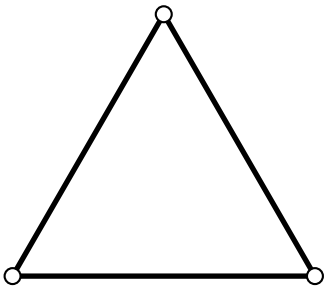
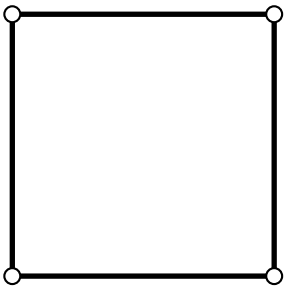
Keep the frames flat. Bars stay straight and keep their length; joints may turn. Sliding or turning the whole frame does not change its shape.

Drawings are recording maps.

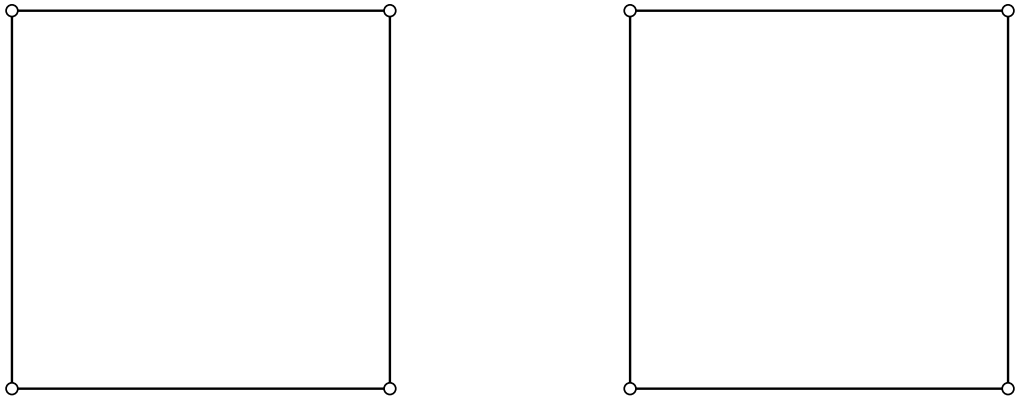
Problem 1: Can you change the shape of the triangle and the square? Draw the shapes you can make.





Problem 2: Make the square hold its shape with the fewest diagonal bars. Draw where you put the bars.

A diagonal bar joins opposite corner pins. It is called a brace.



Problem 3: Remove the diagonal and make shapes with the four side bars. Which shapes can you fit that same diagonal into?
