Move a pawn on the roads. Keep each journey as ordered step tiles; an adult may record. Remove only two adjacent steps along the same road in opposite directions. Replay the other steps in order. The map, start, and finish stay fixed.

replay

remove

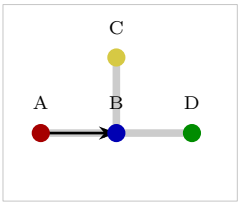

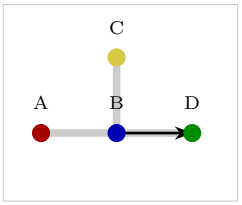

then replay

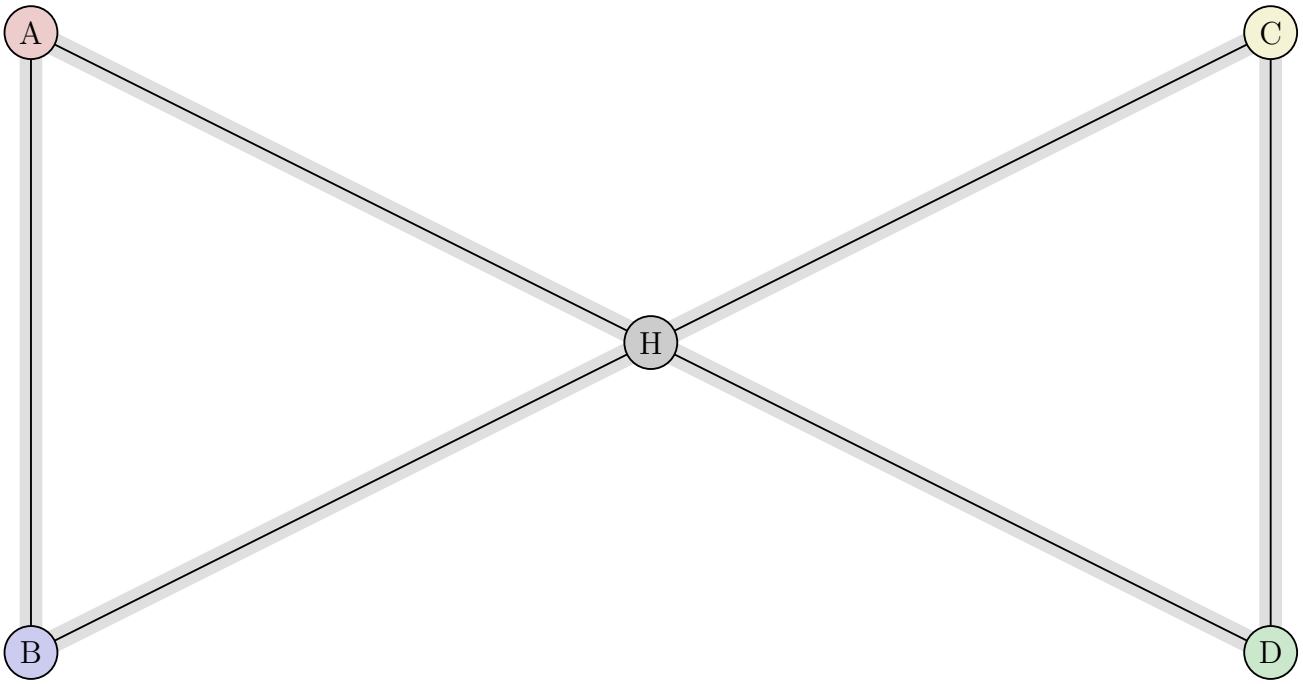

output

No steps left means the pawn stays at its start.

Problem 5: From H, go around the left ring through A, then the right ring through C. Trade only the order of the two full ring trips. Do the two journeys become the same after removing every immediate reversal?

Problem 6: Make two trips from H back to H, each using both rings and at least 12 road steps. One must shorten to staying at H; the other must lose no steps.
