Move a pawn on the roads. Keep each journey as ordered step tiles; an adult may record. Remove only two adjacent steps along the same road in opposite directions. Replay the other steps in order. The map, start, and finish stay fixed.

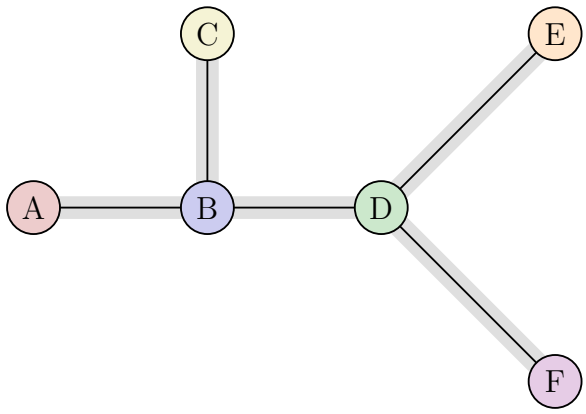

No steps left means the pawn stays at its start.

Problem 1: Shorten each recorded trip until no move is possible. Make a different seven-step trip from C to F that finishes with the same route as the last one.

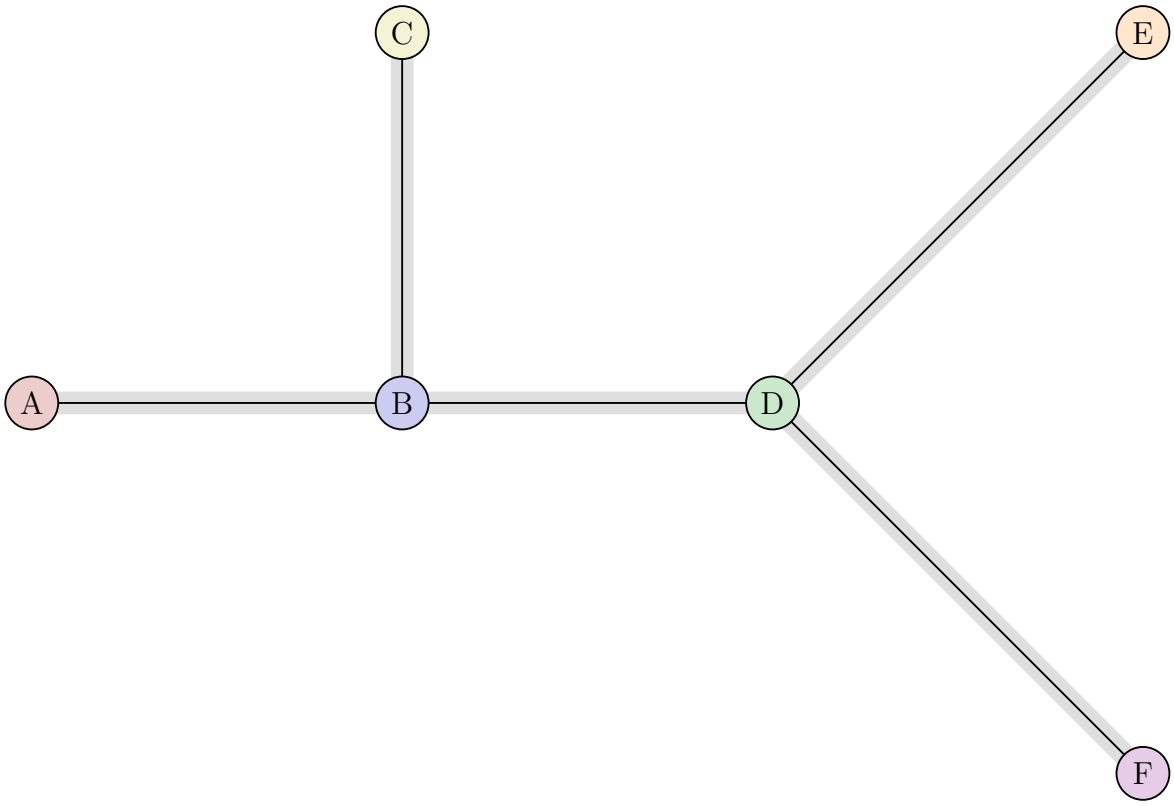

$A \to B \to A \to B \to D \to F \to D \to E \longrightarrow$

$A \to B \to D \to F \to D \to E \longrightarrow$

$C \to B \to C \to B \to D \to F \longrightarrow$

Problem 2: On this map, can a trip from A back to A survive after every immediate reversal is removed? Explain why your answer holds for trips of any length.

Problem 3: Can two trips from C to F finish with different routes after every immediate reversal is removed? Explain using the roads.
