Start with one red and one blue. Draw, return it, add one counter of that color, and mix. For random play, each counter has the same chance; for possible stories, choose the draws yourself.

Problem 1: Find every two-draw color story and its final bag. Which final bags have more than one story?

Marks distinguish counters of the same color. Start with R1 and B1. The first added counter gets mark 2; the next gets mark 3.

draw R1 return it and add R2 next draw could be R2

Problem 2: Each counter in the bag has the same chance of being drawn. Complete every marked two-draw story. Ignore marks when comparing final bags: which red/blue counts have the most stories?
