Start with one red and one blue. Draw, return it, add one counter of that color, and mix. For random play, each counter has the same chance; for possible stories, choose the draws yourself.

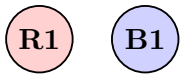

Marks distinguish counters of the same color. Start with R1 and B1. The first added counter gets mark 2; the next gets mark 3.

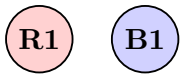

draw R1 return it and add R2 next draw could be R2

Problem 3: Compare two rules, both starting with R1 and B1. Which numbers of red draws have the greatest chance after two draws? Give an exact reason.

return and add a copy

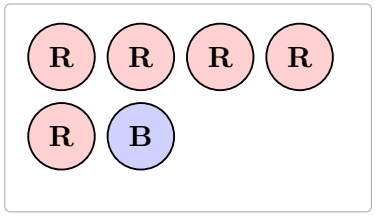

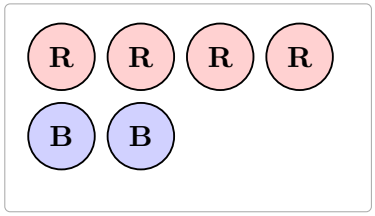

return only

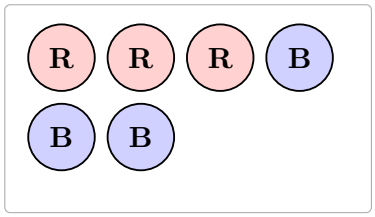

Problem 4: A copying bag ends with three red and two blue. Find all possible three-draw color stories. Could they have different chances?

Problem 5: Use the copying rule for four draws. Find two different color stories for each final bag below, or explain why there is only one.

Problem 6: A friend says one color must eventually vanish from a copying bag. Can that happen?
