Use whole-number heights, including 0. Follow each arrow: the gap between its two old heights becomes the new height at its tail. Make every new tower before changing any old tower. An all-zero start takes 0 moves.

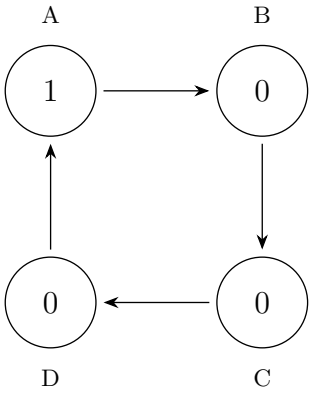

Edge A to B has gap 3, so new A is 3.

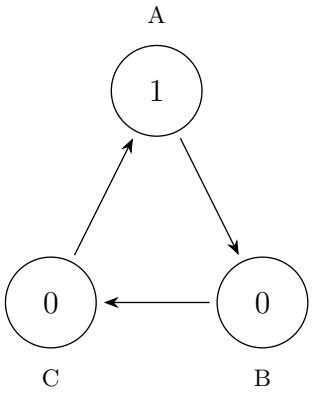

Problem 3: Could each ring be the result of one move? Find an old ring that makes it, or explain why no old ring can work.

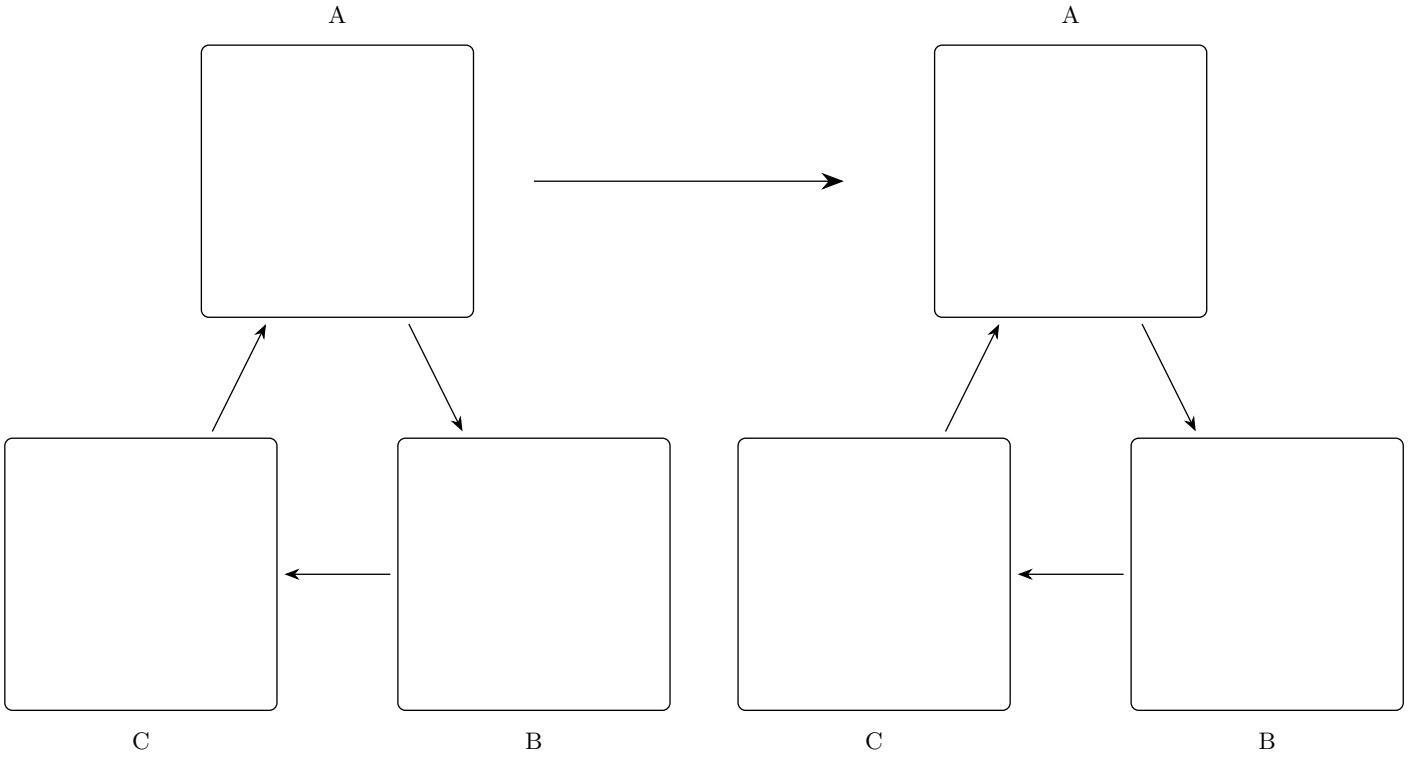

Problem 4: Use the gap rule on both rings. Keep going until the whole ring repeats or becomes all zeros. Does the number of stations change what can happen?

old

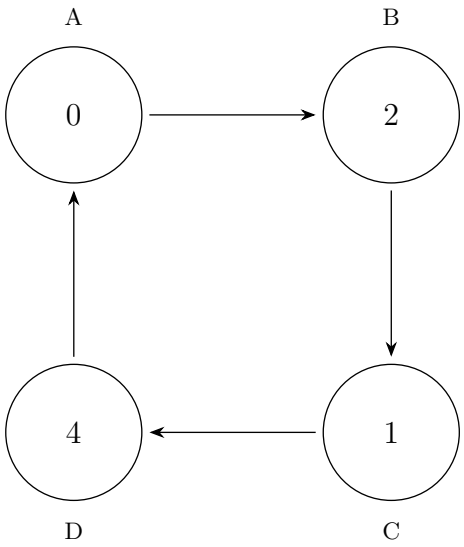

new

	A	B	C
1			
2			
3			

	A	B	C
4			
5			
6			

Problem 5: Try different orders of 0, 1, 2, and 4. Which order lasts longest?

Problem 6: Can a new tower be taller than every old tower? Can the tallest height stay the same for a move? Give an explanation or an example for each claim.
