Use whole-number heights, including 0. Follow each arrow: the gap between its two old heights becomes the new height at its tail. Make every new tower before changing any old tower. An all-zero start takes 0 moves.

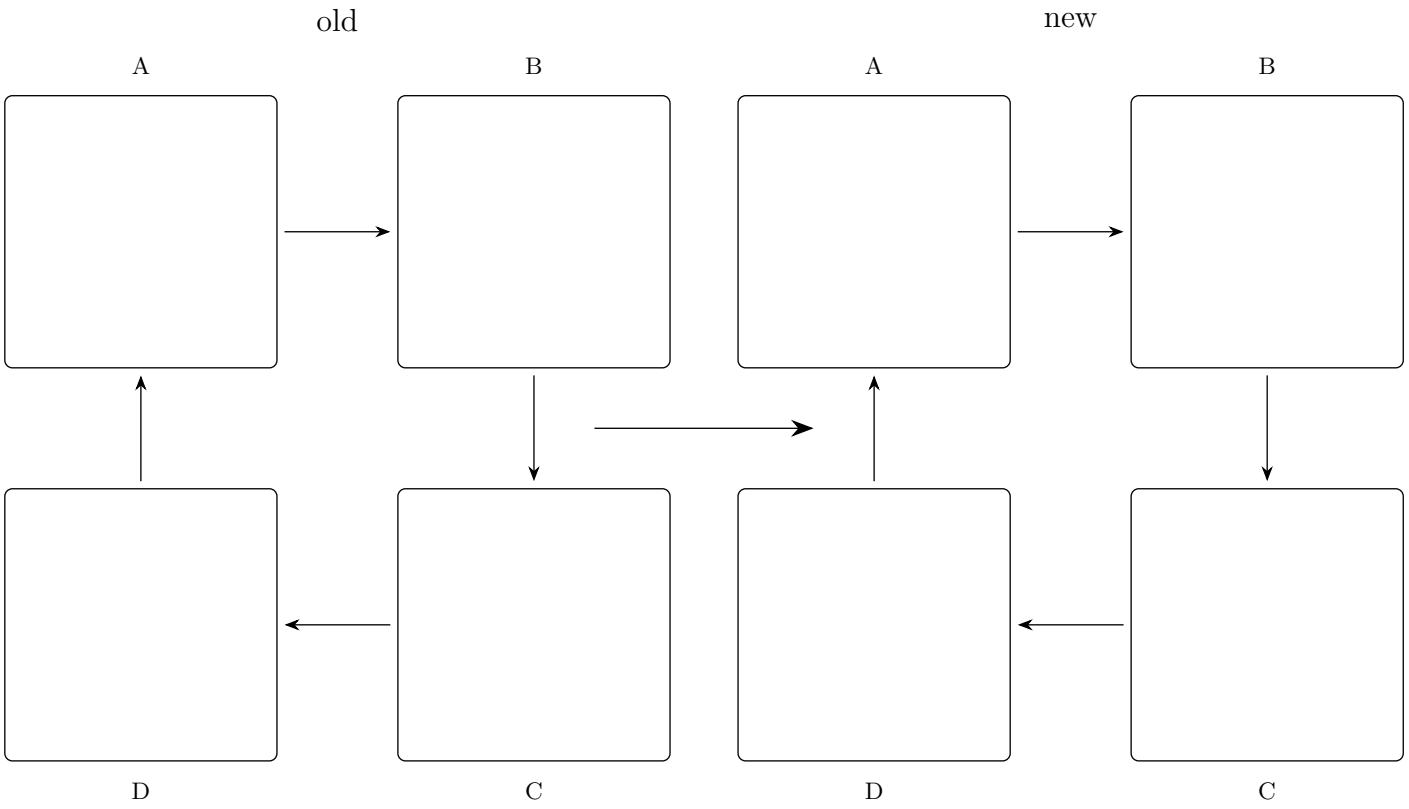

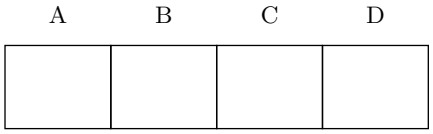

Edge A to B has gap 3, so new A is 3.

Problem 1: Build these starts and keep making new rings. Stop when all four towers are 0.

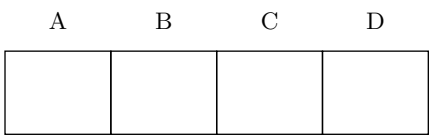

Problem 2: Choose heights from 0 to 4. Find a start that lasts as many moves as you can; count the move that makes all four towers 0.

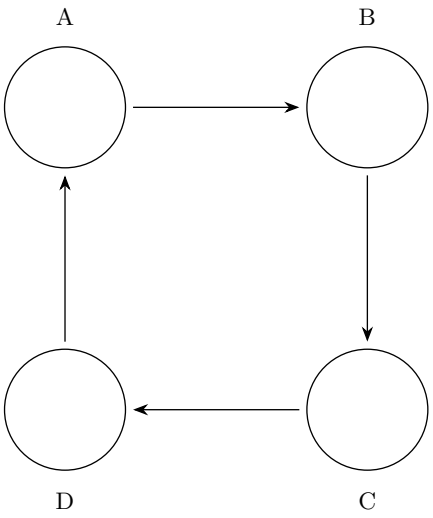

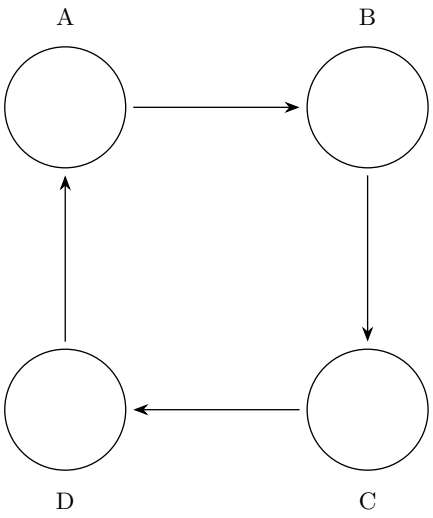

Moves to zero: _____

Moves to zero: _____

Problem 3: Find different starts that become all zeros in one move.

Problem 4: Find different starts that first become all zeros on the second move.
