

Two players take turns taking counters from a pile. On each turn, a player takes 1 counter or 2 counters. Whoever takes the last counter wins.

Problem 1: It is your turn. Circle the counters you take to be sure to win, or cross out the pile if you cannot be sure to win.

1

2

3

4

5

Problem 2: Circle 1st or 2nd to show whether you would rather go first or second with each pile.

6

1st 2nd

7

1st 2nd

8

1st 2nd

9

1st 2nd

Problem 3: It is your turn. Circle the counters you take to be sure to win, or cross out the pile if you cannot be sure to win.

10

11

12

Problem 4: A pile is a trap if the player whose turn it is cannot be sure to win. Put an X on every trap from 1 to 20.

1	2	3	4	5	6	7	8	9	10
---	---	---	---	---	---	---	---	---	----

11	12	13	14	15	16	17	18	19	20
----	----	----	----	----	----	----	----	----	----

Problem 5: Ben goes first and takes 2 counters. Circle each pile where Ben can still be sure to win after that.

5

7

8

10

11

Problem 6: Show every different way a game with 4 counters can go, and then every way a game with 5 counters can go. Circle the counters taken on each turn.

Problem 7: Now each player may take 1, 2, or 3 counters on a turn. Put an X on every trap from 1 to 20.

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20

Problem 8: Now there are two piles, and on your turn you take 1 or 2 counters from one pile. Whoever takes the last counter on the table wins. Circle 1st or 2nd to show whether you would rather go first or second.

Problem 9: Play the game from Problem 8 with two piles of 6 counters. If you go second, how can you win every time, whatever the other player does?

Problem 10: Now there is one pile again, each player takes 1 or 2 counters, and whoever takes the last counter loses. Put an X on every trap from 1 to 20.

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
