

Problem 1: A peg may jump over a peg right next to it, in a straight line, and land on the empty square just past it. The jumped peg is removed from the board. Put a peg on each gray square of strip A and jump until no jump is possible. Color the farthest square a peg landed on. In the boxes, write how many jumps you made and how many pegs are left. Do the same on strips B, C and D.

A

jumps pegs left

B

jumps pegs left

C

jumps pegs left

D

jumps pegs left

Problem 2: Strip E has 3 pegs and two empty squares behind them. Jumps may go backward too. Try every first jump you can find, and play each one out. Color the farthest square any peg ever lands on.

Problem 3: Strips F, G and H each have 4 pegs with one empty square behind them. Try to land a peg on the star. Start each strip with a different first jump. On each strip, color the farthest square a peg landed on.

Problem 4: Put 5 pegs on squares 1 to 5 of strip I. Make the jump that crosses the thick line: the peg on square 4 jumps over square 5 and lands on square 6. Squares 4 and 5 are now empty, and the front peg stands alone. Using only the three pegs on squares 1, 2 and 3, try to land a peg on square 5, right behind the front peg. Color the farthest square those three pegs reach.

Problem 5: Boards A to D. Put a peg on each gray square. Make jumps to get a peg as high above the thick line as you can. Write the number of the highest row a peg reached in the box next to the board's letter. Write 0 if no peg got above the line.

A

B

C

D

Problem 6: Boards E to I each hold 4 pegs, and the star is on row 2. On each board, try to land a peg on the star. Write the highest row reached in the box. Circle the letter of every board where a peg reached the star.

E

			
2			
1			

F

1			

H

			
2			
1			

Problem 7: Find an army of 4 pegs that reaches the star on row 2 and is not board E or board H turned around. Set up each army you try on board J. Color the army in one of the small grids and write the highest row it reached in the box.

Problem 8: Board K holds an army of 8 pegs. Put a peg on each gray square and try to land a peg on the star on row 3. When you succeed, draw your jumps on board L: one arrow for each jump, from the square the peg jumps from to the square it lands on, numbered 1, 2, 3, ... in order.

Problem 9: Set up the same 8 pegs on board K again, but this time make a different first jump from the one you used before, and play on. Write the highest row you reach in the box. Then write how many jumps a game from this army can have at most, and how many pegs are left when the star is reached.

highest row most jumps pegs left

Problem 10: On board M, put 9 pegs on the dark squares, which form a 3-by-3 square. Get a peg as high as you can and write the highest row in the first box. Then put pegs on all 15 squares below the line, dark and light. Get a peg as high as you can and write the highest row in the second box.
