

Problem 1: A peg may jump over a peg right next to it, in a straight line, and land on the empty square just past it. The jumped peg is removed from the board. Put a peg on each gray square of strip A and jump until no jump is possible. Color the farthest square a peg landed on. In the boxes, write how many jumps you made and how many pegs are left. Do the same on strips B, C and D.

jumps pegs left

jumps pegs left

Problem 2: Strips E and F each have 4 pegs with one empty square behind them, so jumps may also go backward. Try to land a peg on the star. Use a different first jump on each strip and play it out. On each strip, color the farthest square a peg landed on.

Problem 3: Strip G has a value written in the corner of each square. Put 4 pegs on the gray squares. Add the values of the squares under your pegs and write the total in the first box. Make a jump and write the new total of the squares under pegs in the next box. Keep going until no jump is possible. Then play again on strip H, starting with the backward jump, and write its totals in its boxes. In the last box, write the value of the square with the star.

G

0	1	1	2	3	5	8	13
---	---	---	---	---	---	---	----

start after jump 1 after jump 2

H

0	1	1	2	3	5	8	13
---	---	---	---	---	---	---	----

start after jump 1 after jump 2

value of the star square

Problem 4: Boards A and B. On each board, place as few pegs as you can below the thick line so that one of them can land on the star. Color the squares where your pegs started and draw each jump as an arrow from the square the peg jumps from to the square it lands on, numbered in order. Write the number of pegs you used in the box.

A

Problem 5: Can an army of 3 pegs land a peg on the star on row 2? Clear board B and set up each 3-peg shape you want to test on it. Color each shape in one of the small grids and write the highest row it reached in the box. Test at least four different shapes.

★	

Problem 6: Board C has 15 squares below the thick line, and the star is on row 3. Find an army that can land a peg on the star using as few pegs as you can. Set up each army you try on board C. Color it in one of the small grids and write the highest row it reached in the box. Circle your best army.

C

Problem 7: Board D is board C with a value written in every square. Put your best army from Problem 6 on it. Add the values of the squares under its pegs and write the total in the first box. Carry out your jumps one at a time, writing the new total after each jump in the next box. Then set up any other army on board D, make three jumps that go sideways or downward, and write the totals in the second row of boxes.

D

8	13	21	13	8
5	8	13	8	5
3	5	8	5	3
2	3	5	3	2
1	2	3	2	1
1	1	2	1	1

[illegible]

other army: start jump 1 jump 2 jump 3

Problem 8: Write the seven largest values that appear below the thick line of board D, and their sum. Then write the value of the star square.

seven largest values: _____

sum star

Problem 9: Board E is board D with one more row on top, and the star is now on row 4. Put pegs on all 15 squares below the thick line and try to land a peg on the star. Write the highest row you reached, the total value of the 15 squares below the line, and the value of the star square.

E

4	13	21	34	21	13
3	8	13	21	13	8
2	5	8	13	8	5
1	3	5	8	5	3
	2	3	5	3	2
	1	2	3	2	1
	1	1	2	1	1

highest row

15 squares

star

Problem 10: Board F holds an army of 20 pegs. Put a peg on each gray square and get a peg to the star. Record each jump in the list as the square the peg jumps from and the square it lands on, for example g3–g5.
