

Problem 1: Put a checker on every dot. The grey square stays empty. A checker can jump over the checker right next to it and land in the empty square just behind it. The checker that was jumped over comes off the strip. Make the jump on the top strip. Then set up the bottom strip and look for a jump. When no jump is left, lift each checker still on the strip and draw a circle where it stood.

Problem 2: Put a checker on every dot. Jump until no jump is left. Then lift each checker still on the strip and draw a circle where it stood. Do all four strips, from the top down. Point to the strips that ended with one checker.

Problem 3: These strips have five squares. Put a checker on every dot. Jump until no jump is left, and draw a circle where each leftover checker stood. Do all five strips. Did any strip end with one checker?

Problem 4: Each strip has six squares. Choose one square to leave empty and draw an X in it. Put a checker on every other dot. Jump until no jump is left, and draw a circle where each leftover checker stood. Use a different X square on each strip. Find an X square that lets you end with one checker.

Problem 5: Count the checkers on the strip before you start, and write that number in the first box. Every checker you jump over goes into the cup. Jump until no jump is left. Count the checkers in the cup and the checkers still on the strip, and write those two numbers in the other boxes. Do the top strip first. Before you play the bottom strip, say how many checkers will go into the cup if you end with one.

start	cup	strip

start	cup	strip

Problem 6: Now the board is a square. A jump can go left, right, up or down, never slantwise. Put a checker on every dot of the top board. Point to every jump you could make, then make them. Draw a circle where each leftover checker stood, and write in the box how many jumps you made. Then do the same on the bottom board.

jumps

Problem 7: The grey square is in a corner. Put a checker on every dot. Jump until no jump is left, and draw a circle where each leftover checker stood. Count the circles and write the number in the box. Play the bottom board and try to leave fewer.

circles

circles

Problem 8: The checkers are soldiers. Soldiers start on dots below the thick line, never above it. They jump the same way as before. Get a soldier onto the star. Use as few soldiers as you can. When your army works, draw it on the small board: colour one small square for each soldier. Write how many soldiers you used in the box.

soldiers

Problem 9: Now the star is two rows above the thick line. Get a soldier onto the star with as few soldiers as you can. Draw your best army on the small board and write how many soldiers it used.

soldiers

Problem 10: Put a checker on every dot of the top board. Point to every jump you could make, then make them. Draw a circle where each leftover checker stood, and write in the box how many jumps you made. Then do the same on the bottom board.

Problem 11: The star is three rows above the thick line. Get a soldier onto the star with as few soldiers as you can. Draw your best army on the small board and write how many soldiers it used.

soldiers

Problem 12: Use pennies on these strips. Put pennies on some of the dots to the left of the thick line, as many as you like. Jump until no jump is left. On the top strip, get a penny onto the star with as few pennies as you can, and write that number in the box. On the other three strips, try to get a penny onto the star with any number of pennies. On each strip, colour the square farthest to the right that a penny ever reached.
