

Problem 1: A checker may jump over the checker next to it, to the left or to the right, into the empty square right behind it. The checker that was jumped over comes off the strip. Put a checker on each circle of strip A. Make a jump if you can. Do the same on strip B and on strip C. Put a mark in the box beside each strip where a jump was possible. On each strip where you jumped, point to the square where the checker landed.

Problem 2: Put a checker on each circle of strip D. The last square is empty. Jump until no jump is left. Make one tally mark in the long box for each jump. On the small strip, draw a dot in each square that still has a checker. Write how many checkers are left in the number box.

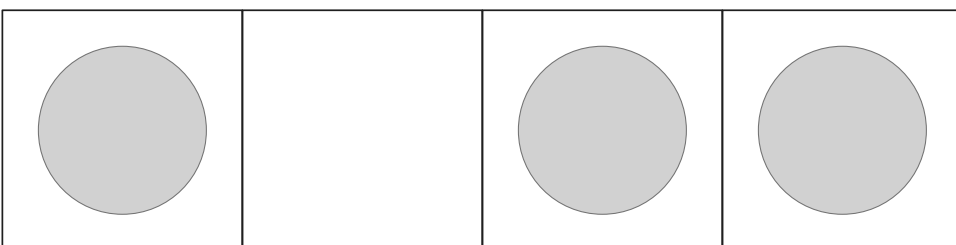

D

left

Problem 3: Put a checker on each circle of strip E. This time the second square is empty. Jump until no jump is left. Make a tally mark for each jump, draw dots on the small strip for the checkers that are left, and write how many. Then look at the small strips of Problems 2 and 3 together. Point to the strip that let you jump more times.

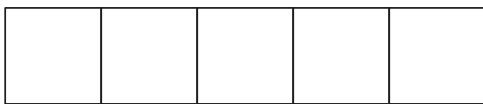

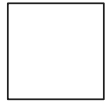

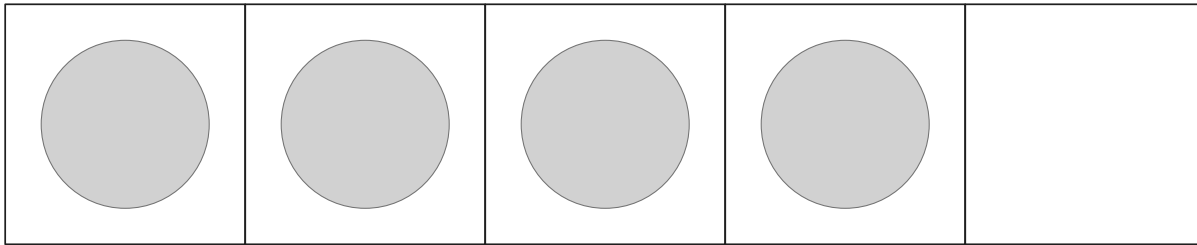

E

left

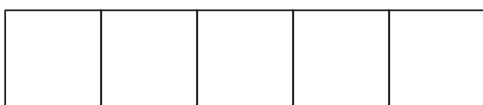

Problem 4: Strips F, G and H have five squares each, with the empty square in a different place on each. On each strip, put a checker on each circle and jump until no jump is left. Try to leave as few checkers as you can. Draw dots on the small strip under it for the checkers that are left and write how many. On strip H, play twice, starting with a different jump each time, and draw both endings. Put a mark in the box beside the one strip where you could choose between two jumps.

Problem 5: Strips J and K have the empty square at the end, like strips D and F. Put a checker on each circle of strip J and jump until no jump is left. Draw dots on the small strip for the checkers that are left and write how many. Do the same on strip K.

						left

							left	
--	--	--	--	--	--	--	------	--

Problem 6: The four small strips at the top are strips D, F, J and K again, from the shortest to the longest. Draw your four endings on them. Point to where the checkers are left each time and show the adult what is the same on all four. The last small strip has eight squares. Before you play, draw dots where you think the checkers will be left on a strip of eight with the empty square at the end. Then put seven checkers on the strip of eight the adult gives you, with the last square empty, play, and check your drawing.

Problem 7: Board A has a thick line across it and a star just above the line. Put a checker on each of the two circles below the line. A checker may also jump up or down, over the checker next to it into the empty square right behind it. Jump so that a checker lands on the star. Then take both checkers off, put one checker on the circle just under the line, and try to get it onto the star. Tell the adult whether one checker can reach the star.

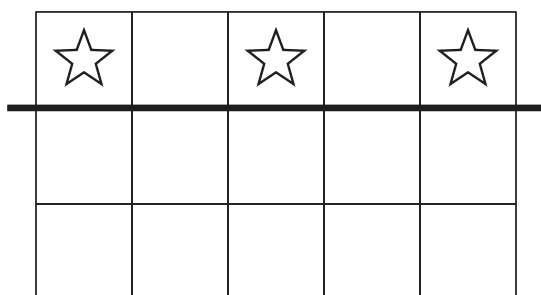

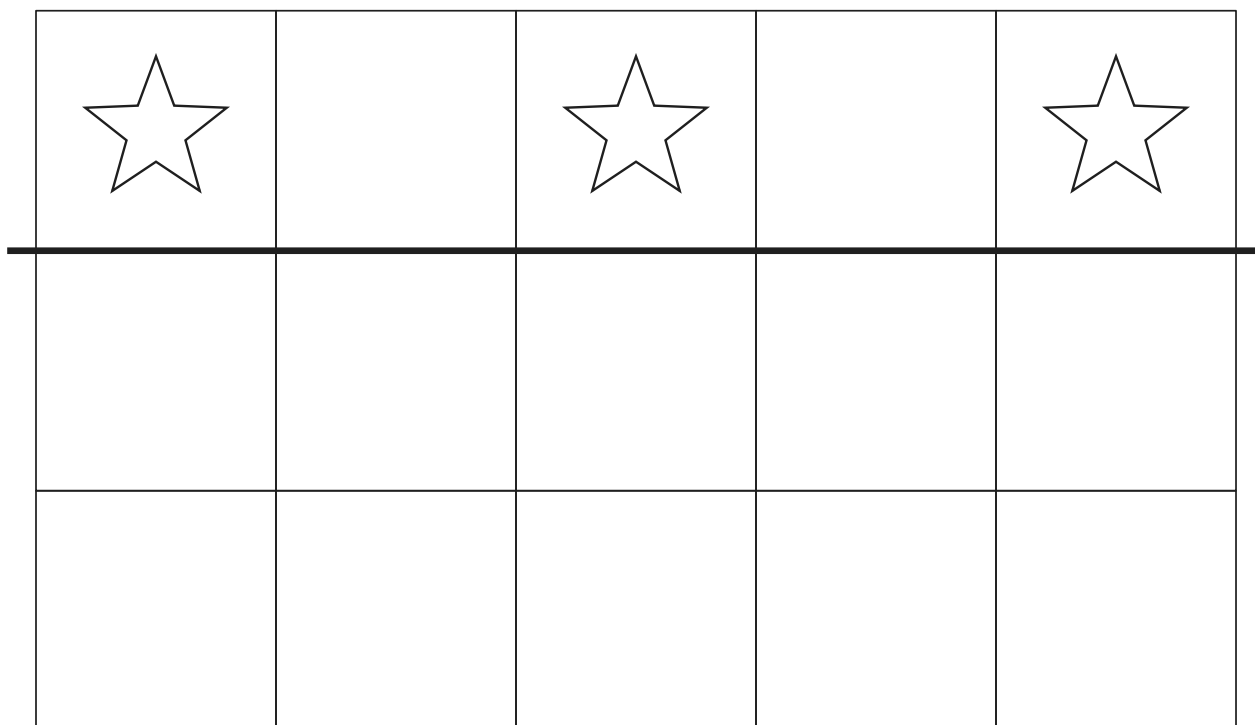

A

Problem 8: Board B has two stars above the line. Put checkers below the line so that after your jumps a checker sits on each star. Use as few checkers as you can. When it works, draw a dot on the small board in each square where a checker started, and write how many checkers you used in the number box.

B

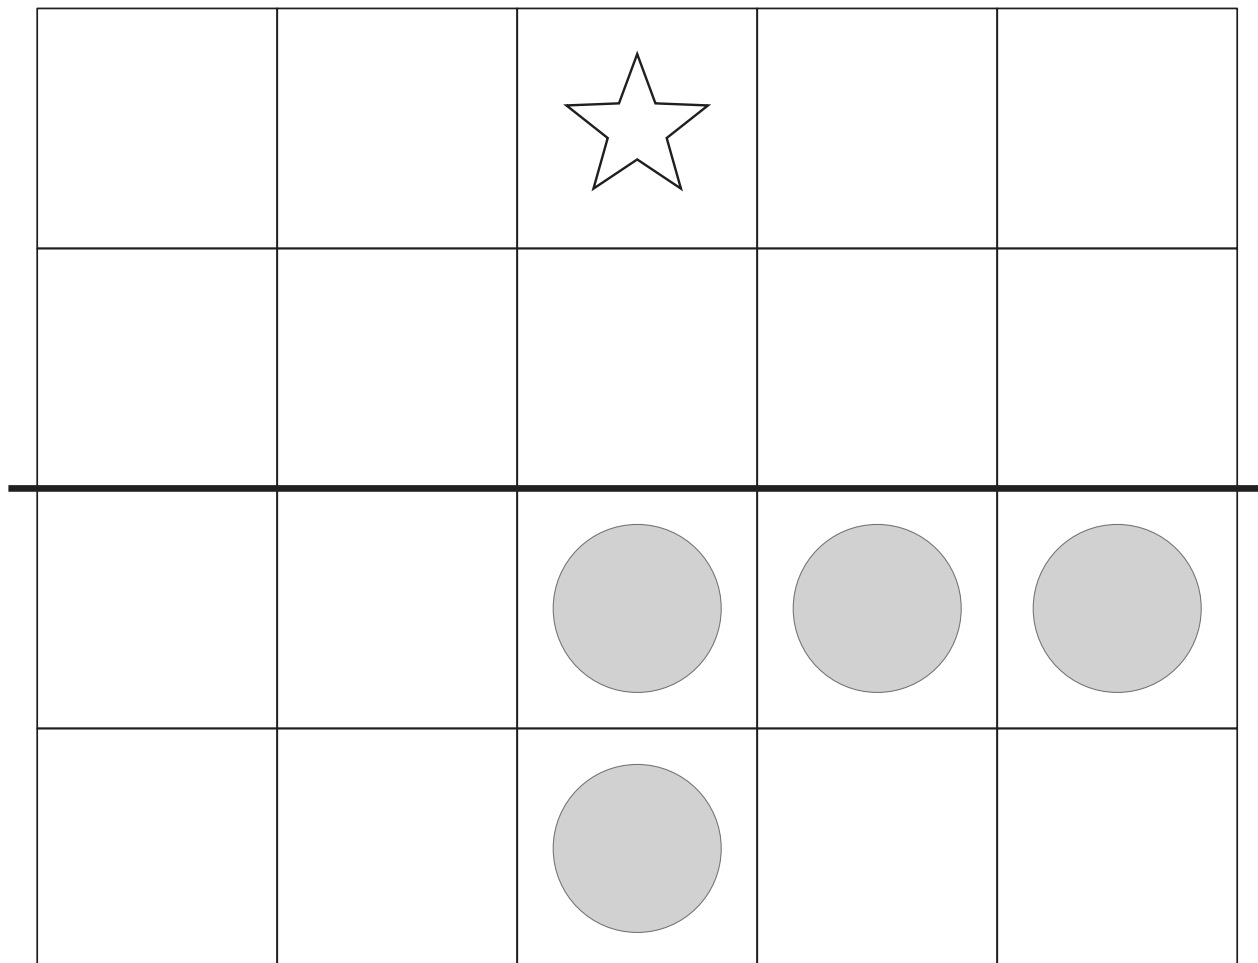

Problem 9: Board C has three stars above the line. Put checkers below the line so that after your jumps a checker sits on each star. Use as few checkers as you can. Draw a dot on the small board in each square where a checker started, and write how many checkers you used. Look at your numbers for one star, two stars and three stars. Tell the adult how many checkers four stars would need, and show with the checkers why.

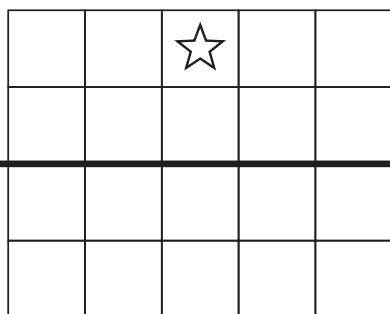

C

Problem 10: On board D the star is two rows above the line. Put a checker on each of the four circles. Make jumps so that a checker lands on the star. Draw the first jump as an arrow on small board 1, the second on small board 2 and the third on small board 3.

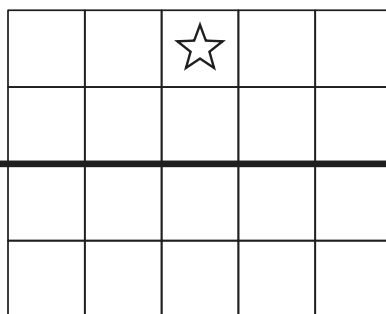

D

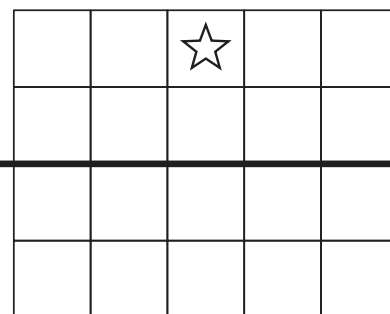

1

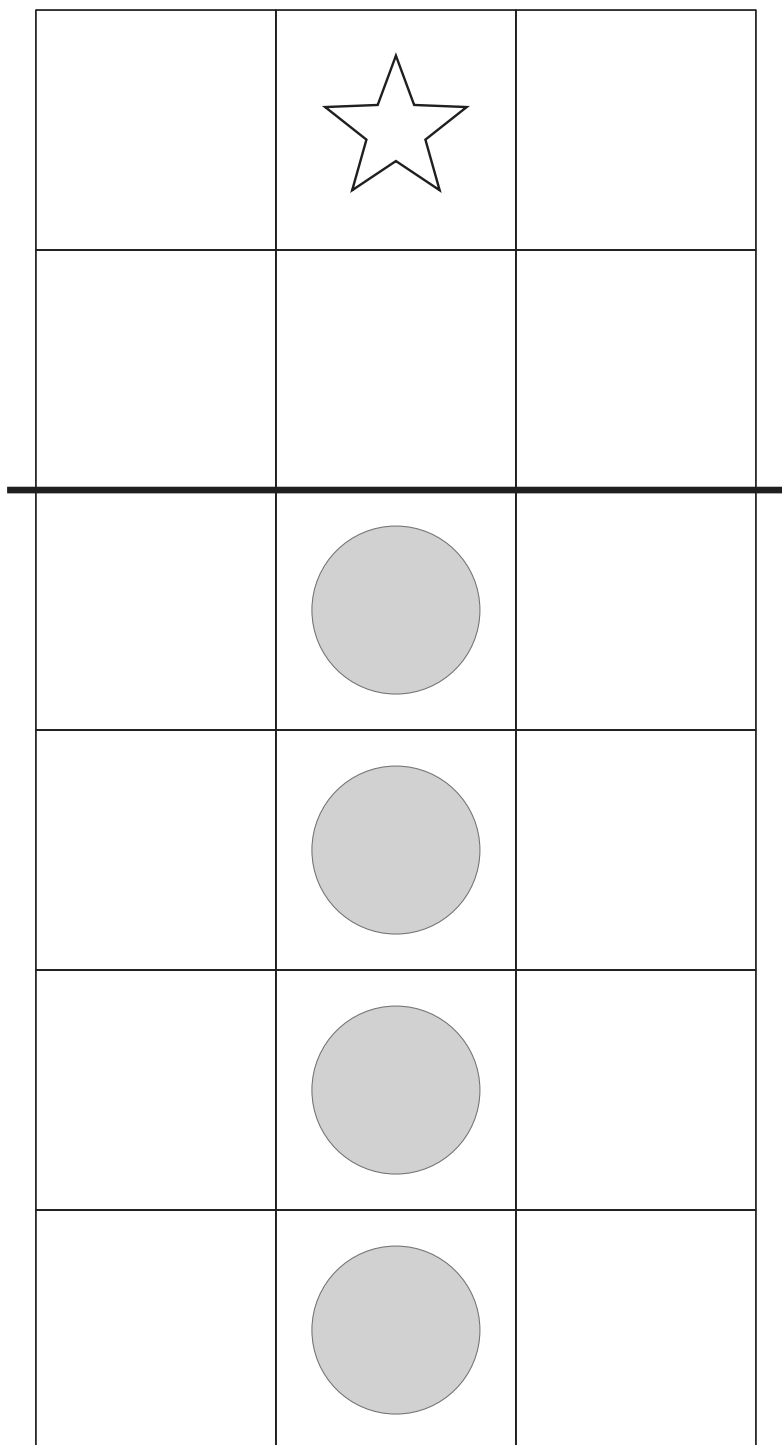

2

3

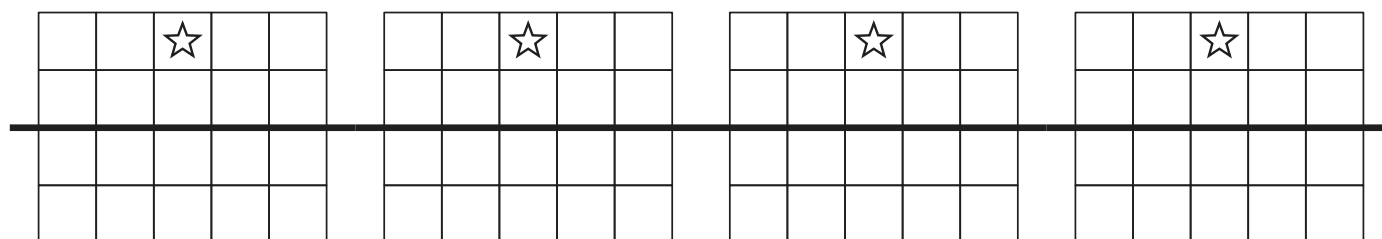

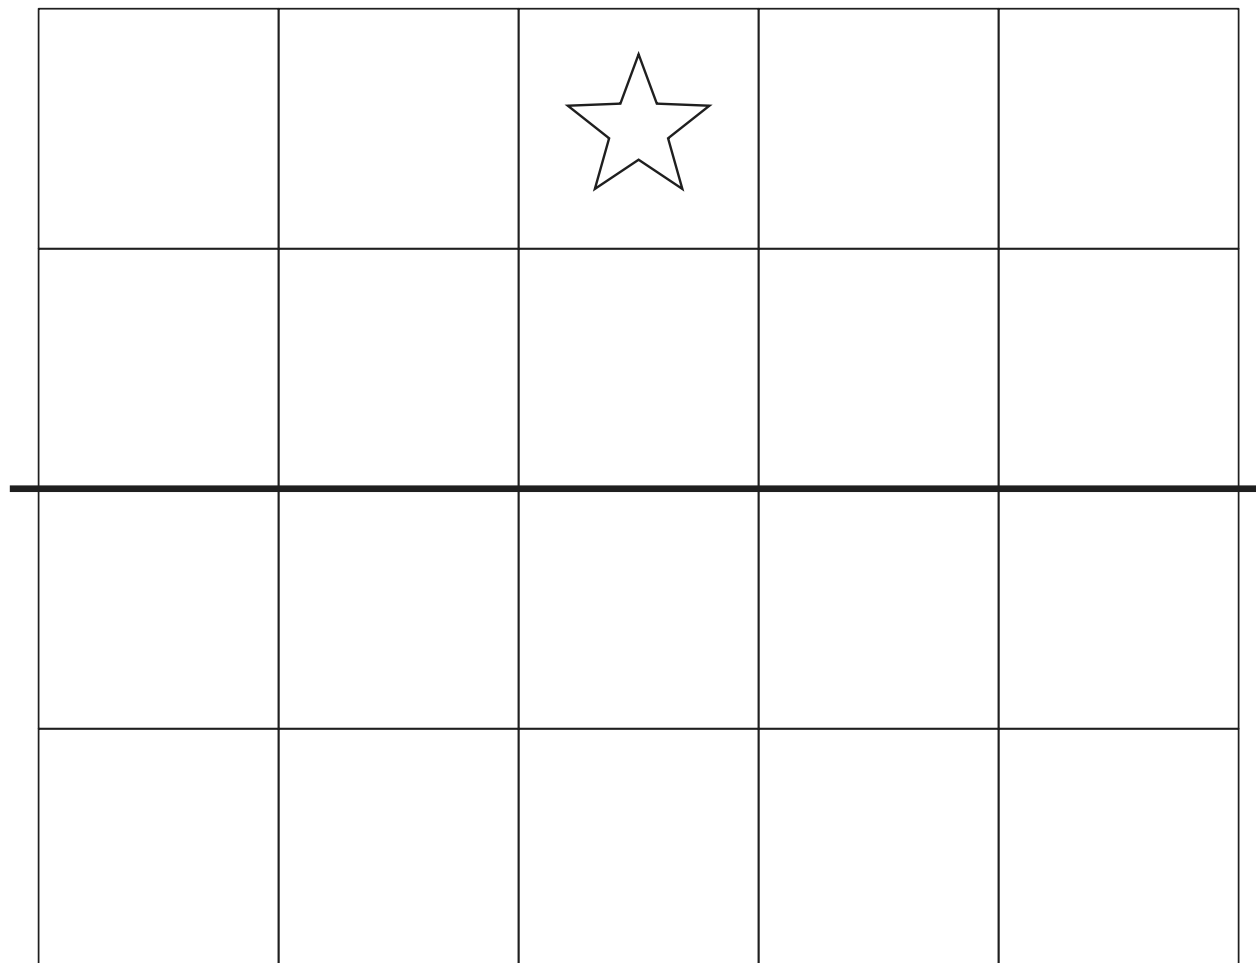

Problem 11: Board E has four circles in a column under the star. Put a checker on each circle. Try to get a checker onto the star. Colour the highest square that any checker reached. Boards D and E both use four checkers. Point to the board where a checker reached the star.

E

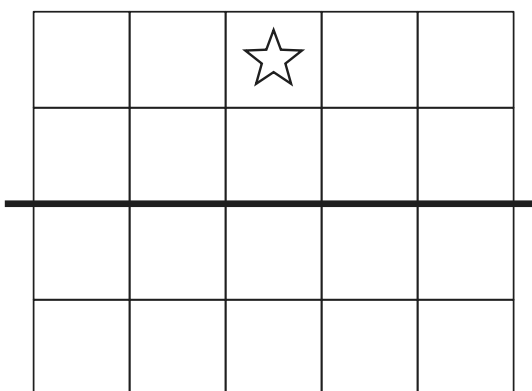

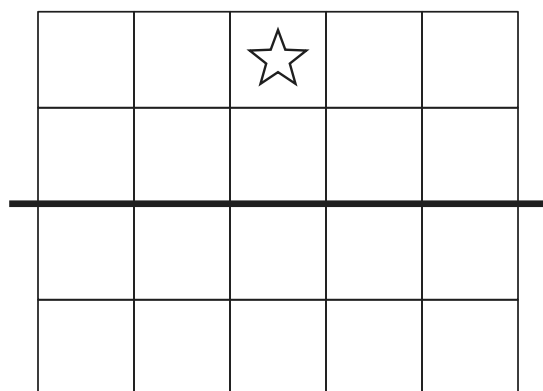

Problem 12: On board F the star is two rows above the line. Take three checkers. Put them anywhere below the line and try to get one onto the star. Draw each army of three you tried on a small board. Cross out each army that did not reach the star.

F

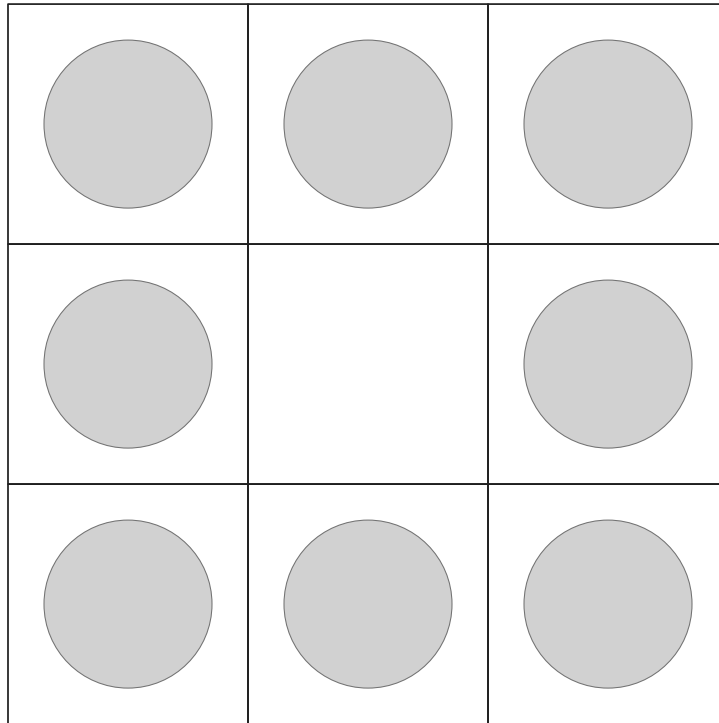

Problem 13: On board G the star is two rows above the line. Take four checkers. Find two different ways to place them below the line so that a checker reaches the star. Draw both armies on the small boards, with a dot for each checker.

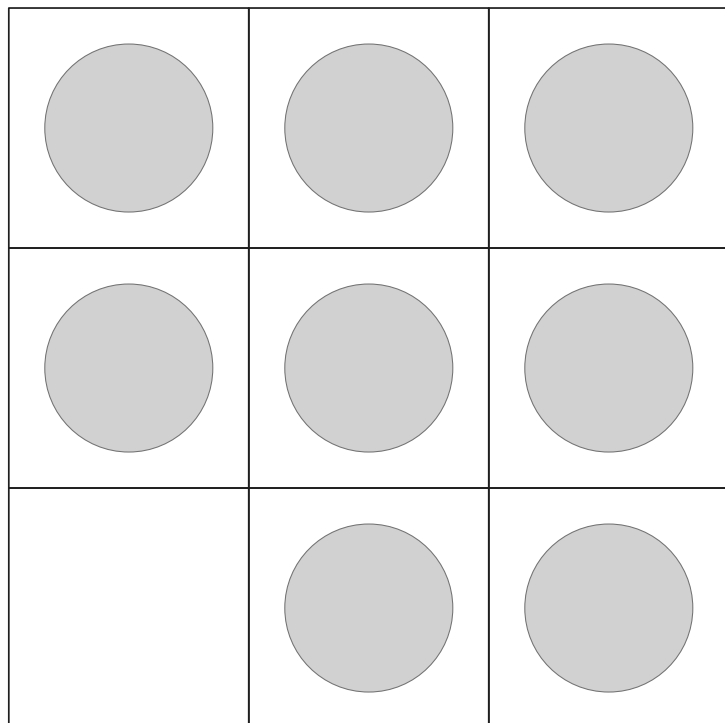

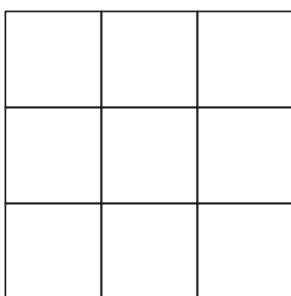

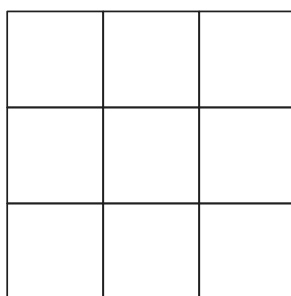

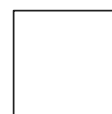

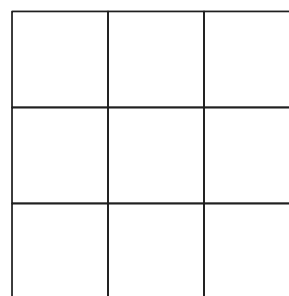

G

Problem 14: Board H has nine squares. Put a checker on each circle. The middle square is empty. Look for a jump. If there is none, tell the adult why not. Then take the checker off one corner and put it in the middle square. Now find every jump you could make first, and point to each one.

H

Problem 15: On board J one corner square is empty. Put a checker on each circle. Jump until no jump is left. Make a tally mark for each jump, and draw dots on small board 1 for the checkers that are left. Play again, starting with the other first jump, and record on small board 2. Play a third time, choosing differently later on, and record on small board 3. Write the fewest checkers you managed to leave in the number box.
