

Keep the dots fixed and in different places. Use straight-line distance to their centers. A dot's region includes every place where it is nearest, including shared ties. The frame shows part of a larger plane.

Problem 1: Write the nearest dot's letter beside each cross, including every tied letter. Draw the boundary that divides all the places on the sheet between A and B.

Problem 2: Draw the three regions, including all the places shared by nearest dots.

Problem 3: Draw the three regions. Could a place belong to all three dots? Explain.

Problem 4: Draw the four regions. Find every place that belongs to more than one nearest dot.

Problem 5: Draw the four regions. Which pairs of dots share a boundary between their regions?

Problem 6: E is added to the four dots in Problem 4. Draw the five new regions. Which parts of the old shared boundaries disappear?

Problem 7: Put D in the frame so its region shares places with A's and B's regions, but no places with C's region. Draw all four regions.

Problem 8: Place B and C so A owns exactly the shaded part of the frame. Draw all three regions.
