

# What can the tiny person see?

Name: \_\_\_\_\_

Date: \_\_\_\_\_

Build towers of heights 1, 2, and 3. Taller towers hide shorter towers behind them. Look from one end. Count **towers you can see**, not cubes.

## 1. Build and look.

Play with your towers. Then copy this row and look from both ends.

## 2. Same towers, different views.

Make a row showing all three towers from the left. Now make a row showing just one. Can you show exactly two?

**Draw a row with two visible towers. Circle the towers you see.**

A large empty rectangular box for drawing a row of towers.

## 3. Two ends at once.

Can you make a row that shows two towers from the left **and** two from the right? Can it show one from each end? Try; then explain.

Build first. Explain by pointing, talking, or drawing.

# Have we found every skyline?

Name: \_\_\_\_\_

Date: \_\_\_\_\_

## 4. Find all the orders.

Move the towers. Have an adult record each new order. Keep the left end fixed: turning the row around may make a new order.

|   | Tower order | Seen left | Seen right |
|---|-------------|-----------|------------|
| 1 |             |           |            |
| 2 |             |           |            |
| 3 |             |           |            |
| 4 |             |           |            |
| 5 |             |           |            |
| 6 |             |           |            |

**How can we be sure no order is missing?**

## 5. A tiny city.

Use heights 1 and 2 once in **every row and every column**. Find both cities. Which one shows two towers from the left of the top row?

Build first. Explain by pointing, talking, or drawing.
