

Fill every spot. Only counter kinds and spots count; the direction of a symbol does not. Keep the original still. Turn or turn over its tracing copy until all spots line up. A whole turn does not count.

Problem 1: Find how few kinds of counter can stop every turn and flip on this ring. Use up to three kinds; neighbors may match.

Problem 2: Find how few kinds of counter can stop every turn and flip on this ring. Let someone test your best pattern.

Problem 3: Find how few kinds of counter can stop every turn and flip on this ring. Can you explain why fewer kinds would fail?

Problem 4: Find a six-ring pattern using only two kinds of counter that stops every turn and flip. Show how you know every possible move fails.

Problem 5: Find an eight-ring pattern with two kinds of counter that stops every turn and flip. How few counters of one kind can it have?
