Heights are whole numbers, including 0. Neighbors differ by at most 1. Black circles are fixed clues.

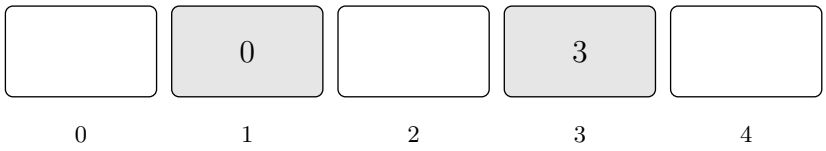

One marker in each column shows its tower height.

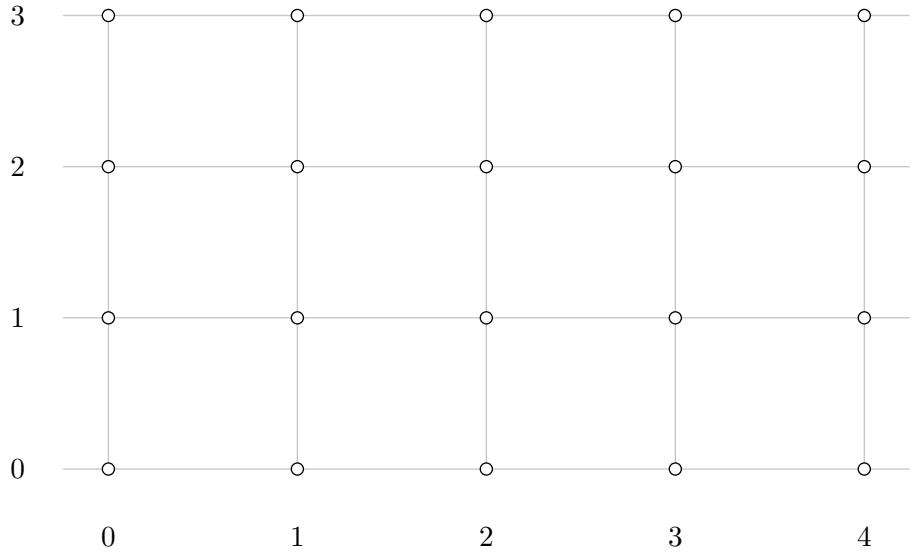

Problem 4: Decide which clue sets can be completed. Build the possible ones; explain what prevents the others.

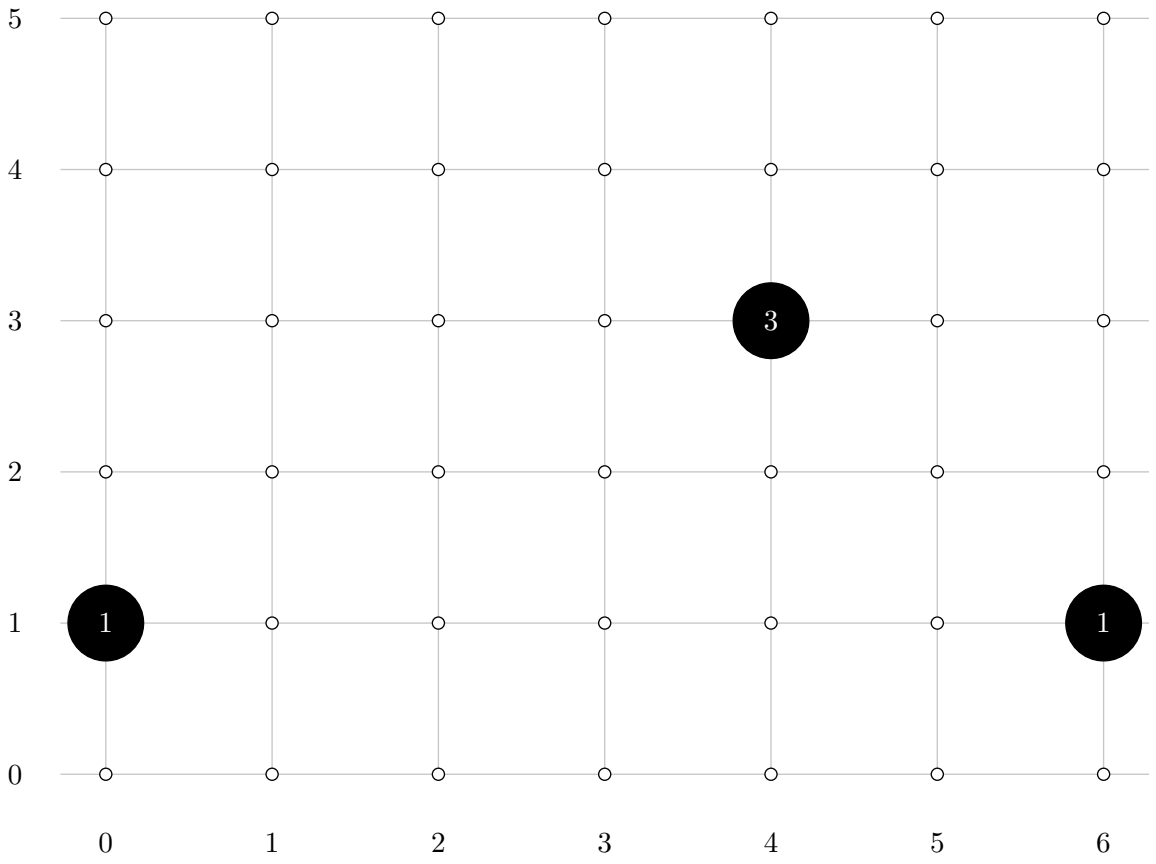

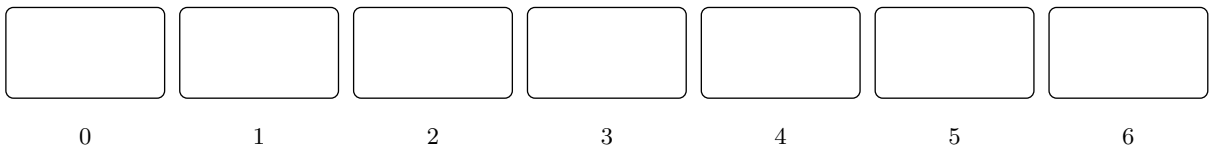

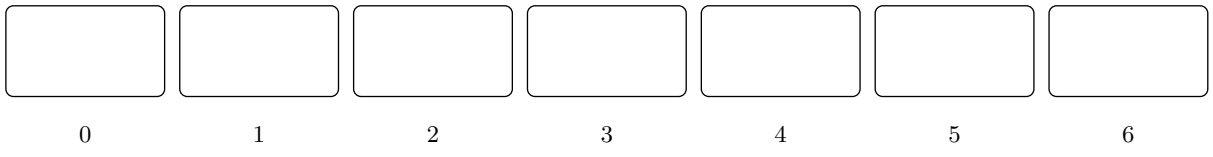

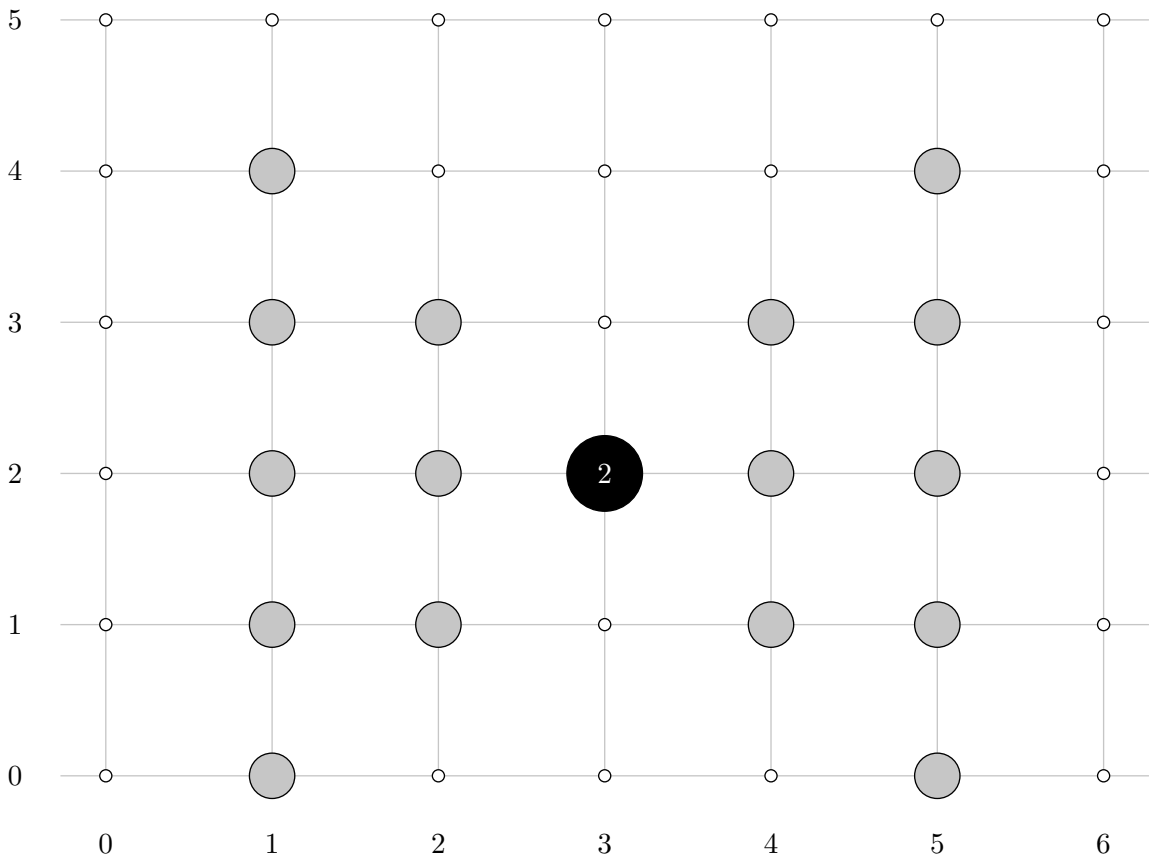

Problem 5: Make one landscape that is as low as possible at every site, and one that is as high as possible at every site. Explain why no marker can go beyond yours.

Problem 6: A single clue is fixed at height 2. The shaded marks show all allowed heights at nearby sites. Find the allowed heights at sites 0 and 6.

Problem 7: A row has at least one clue. Suppose every pair of clues differs by no more than the steps between them. Must the whole row be fillable? Give a construction that always works, or a set of clues that defeats the claim.
