Each instruction names a slot and a color. Set that slot to that color on both boards, even if it is already that color. Slots are 1, 2, 3 from left to right.

Problem 1: Find the fewest instructions needed to make these boards match. Build pairs needing fewer instructions. Can any pair need more?

Problem 2: Which stories guarantee that any two starting boards will finish matching? Explain why your answer holds for every starting pair.

Problem 3: Beside each story, mark a slot the first time the story names it. Can two different starting boards match before all three slots are marked? Make one example that does and one that does not.
