Problem 1: Make every different row using these three cards once each.

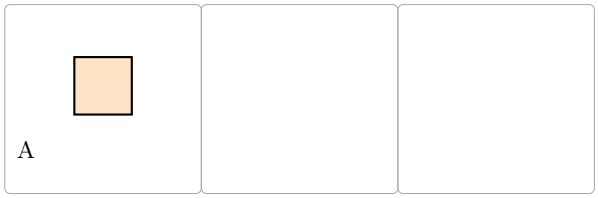

Mix the three picture cards in a cup. Draw the first without looking and keep it out. Draw the second from the two left. Put the last card at the end. Return all cards for a new row.

Example: choose triangle, then square; circle is left.

Problem 2: Each row starts with the card drawn first. Find every row that can still happen. Could two different first-two draws make the same row?

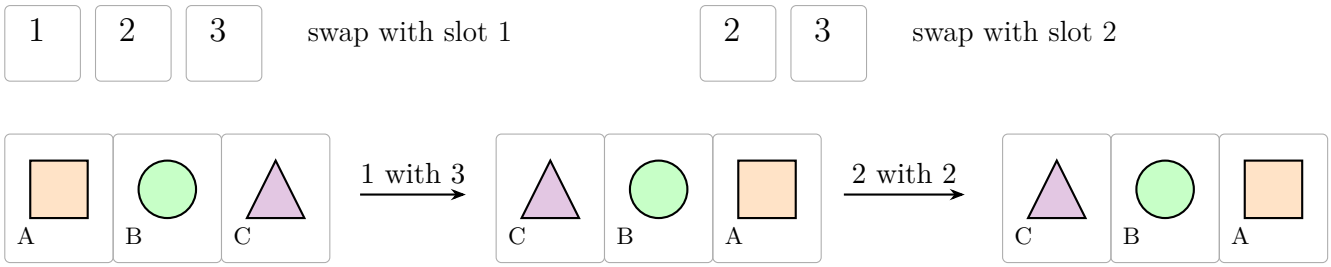

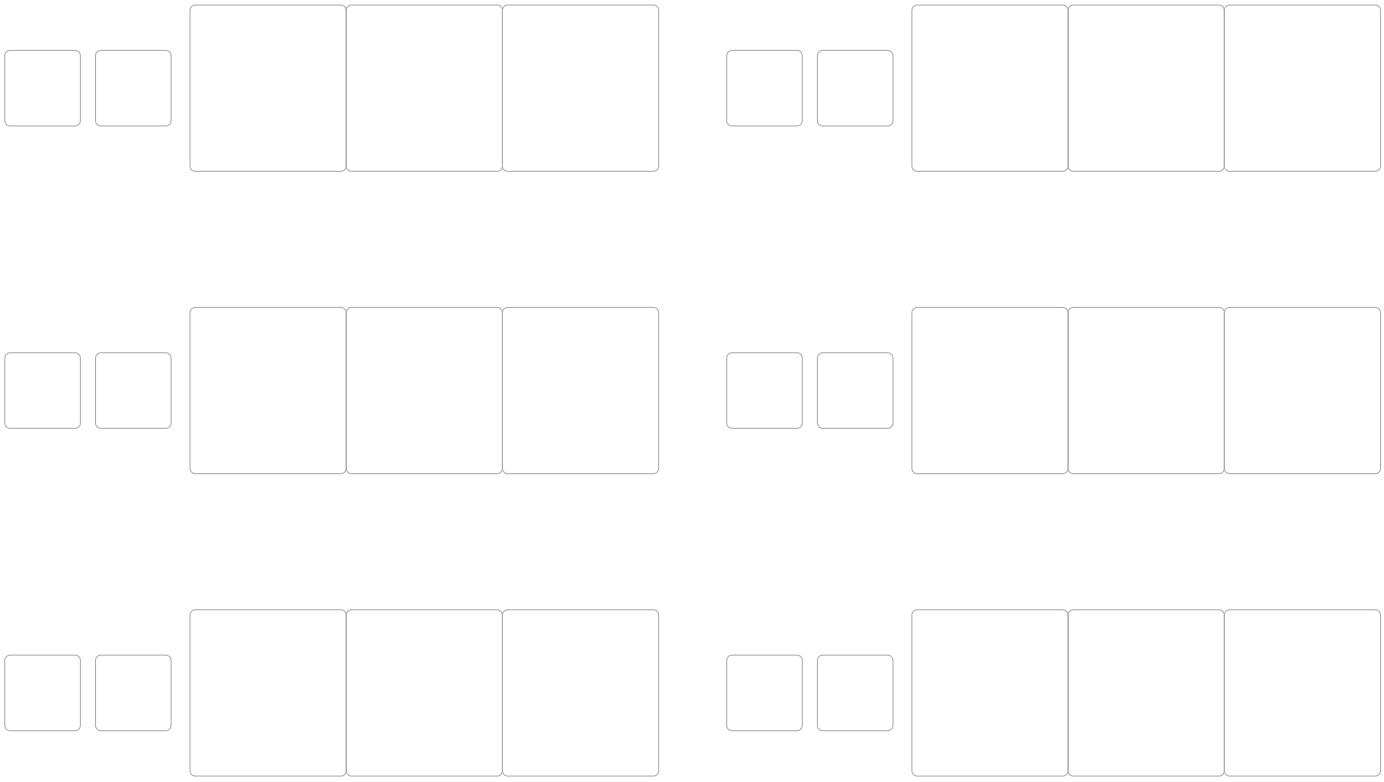

Start A B C. Pick a ticket from 1, 2, 3 and swap that slot with slot 1. Then pick from 2, 3 and swap that slot with slot 2. A slot may swap with itself.

Problem 3: Start with A B C and choose tickets to make every row. Can any row be made by two different ticket stories?

Problem 4: Remove one ticket from the first set, leaving the second set alone. Which rows become impossible for each missing ticket?

2	3						
1	3						
1	2						

Problem 5: Start with these two different rows and give both the same two-ticket story. Can they ever finish alike?
