Start with one red and one blue. Draw, return it, add one counter of that color, and mix. For random play, each counter has the same chance; for possible stories, choose the draws yourself.

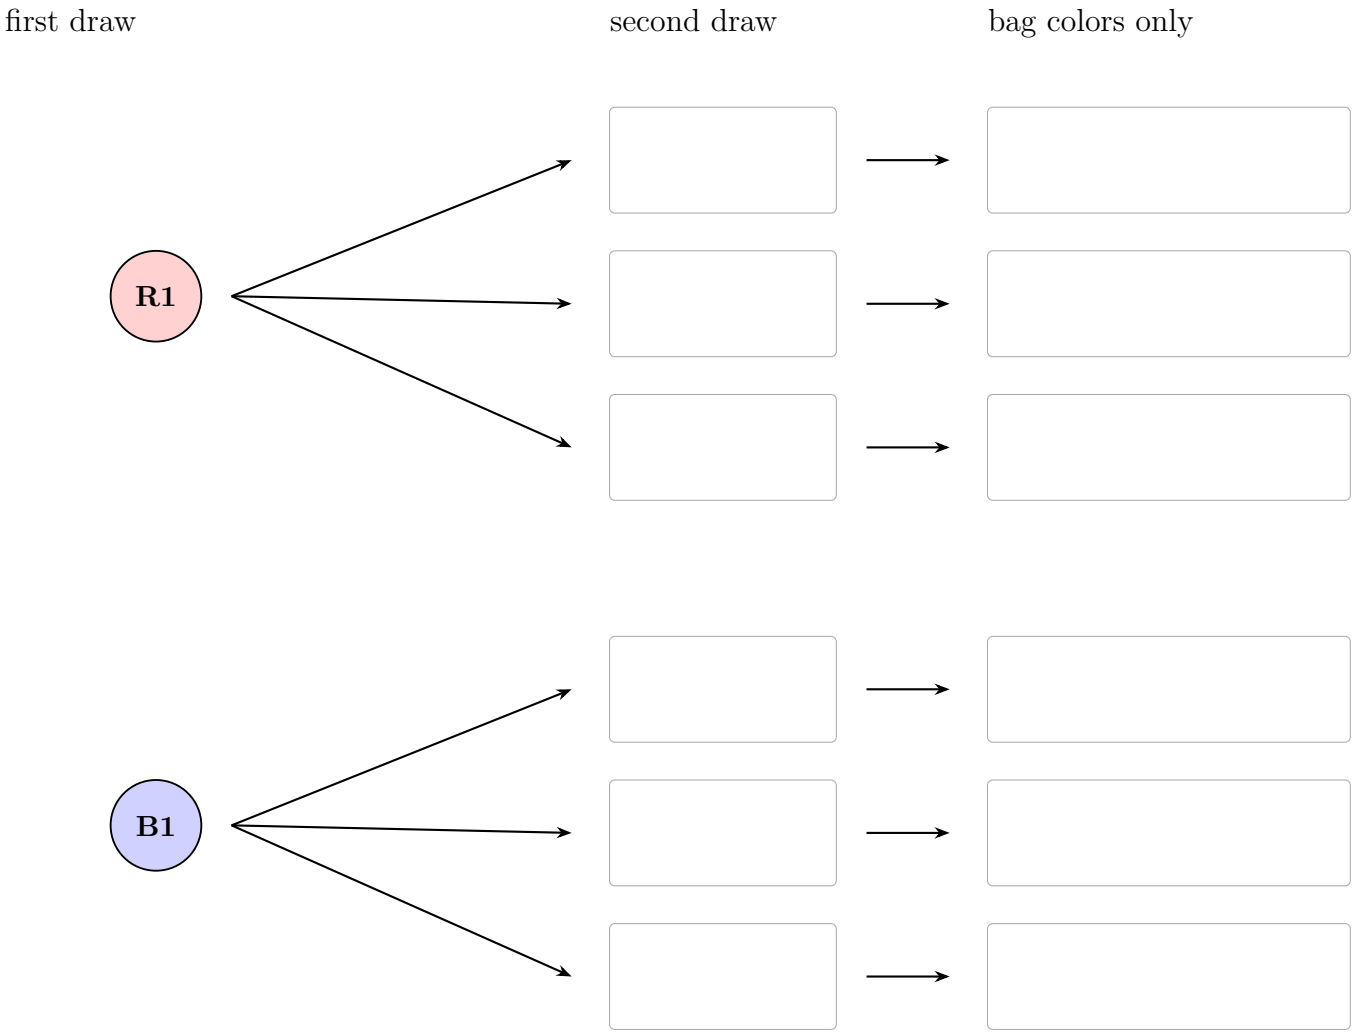

Problem 1: Find every two-draw color story and its final bag. Which final bags have more than one story?

Marks distinguish counters of the same color. Start with R1 and B1. The first added counter gets mark 2; the next gets mark 3.

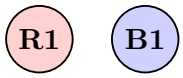

draw R1 return it and add R2 next draw could be R2

Problem 2: Complete every marked two-draw story. Ignore marks when comparing final bags: which red/blue counts have the most stories?

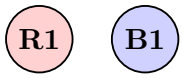

Problem 3: Compare two rules, both starting with R1 and B1. Which numbers of red draws have the greatest chance after two draws? Give an exact reason.

return and add a copy

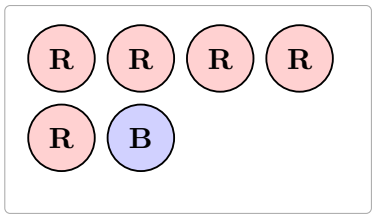

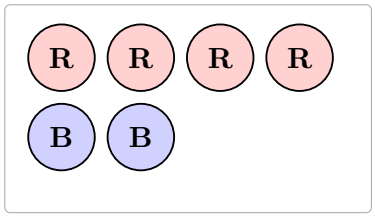

return only

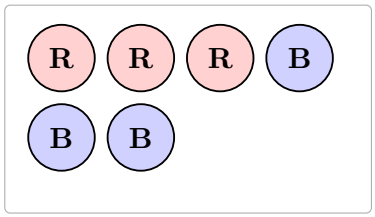

Problem 4: A copying bag ends with three red and two blue. Find all possible three-draw color stories. Could they have different chances?

Problem 5: Use the copying rule for four draws. Find every color story for each final bag below.

Problem 6: After four copying draws, which bag is more likely, if either: five red and one blue, or three red and three blue?
