Use the loose footprints. Build each border in its box, or on a long strip if it needs more room. A match must fit every footprint. Test with a tracing copy; leave the original in place.

Problem 5: Make a border that matches when you flip it over the middle line. Change it so that the flip fails.

A half-turn turns the copy halfway around a chosen point on the table. You may choose any point.

Problem 6: Make a border that matches after a half-turn. Make another that cannot match after a half-turn around any point.

Problem 7: Trade borders with your partner and find the moves that match.
