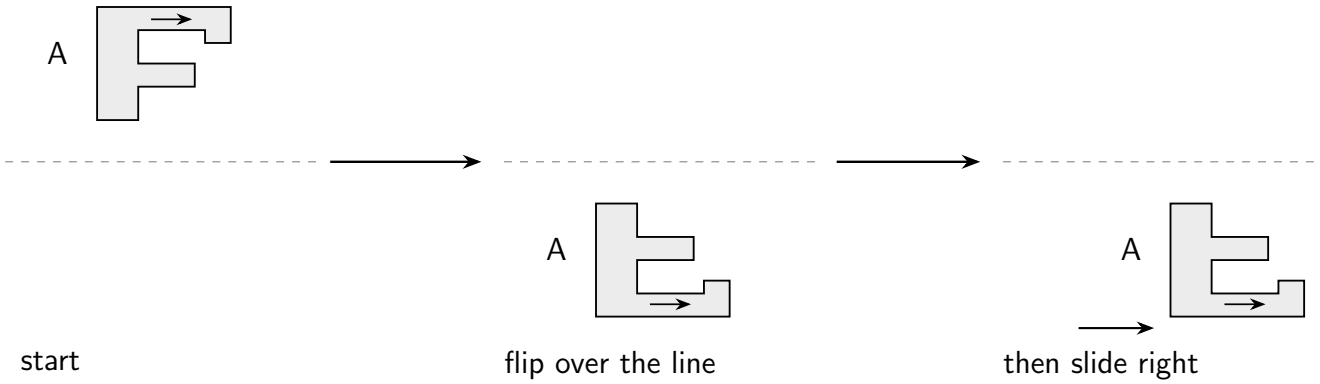
Use the loose footprints and long strips. Each border repeats forever both ways. A match must fit every footprint. Only footprints count, not strip ends or guide lines. A slide must move the copy. Test with a tracing copy; leave the original in place.

Problem 1: Make two repeating borders whose smallest matching slides are different lengths. Mark one matching slide on each tracing copy.



Problem 2: A glide is a flip over the middle line followed by a nonzero slide along it. Make a border that matches after a glide, but fails after the flip alone.

Problem 3: On your border, how does the shortest matching glide compare with the shortest matching slide?

A half-turn turns the copy halfway around a chosen point on the table. You may choose any point.

Problem 4: Make a repeating border that matches after a flip over the middle line. Can you keep it from matching after any half-turn?

Problem 5: Make a repeating border that matches after a half-turn, but fails after the flip over the middle line.

Problem 6: Move footprints in one of your borders so that an old matching move fails but the new border still repeats. You may use a larger repeating part.
