Use whole squares inside the gray shape. Cover all squares with some gray area. A touch at an edge or corner adds no square.

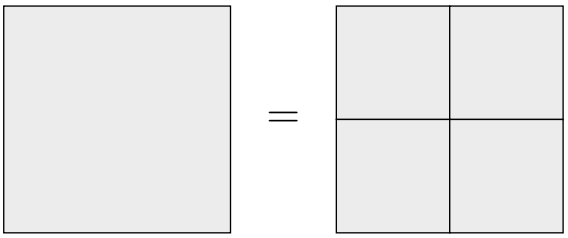

whole

partial

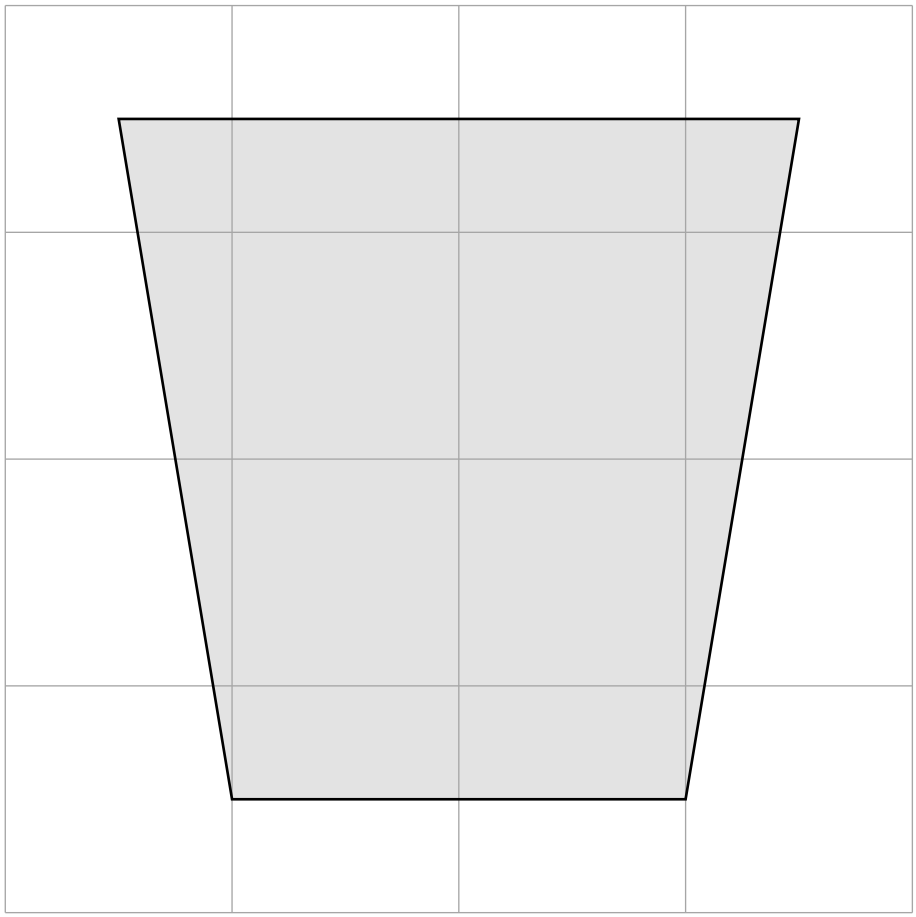

outside

1 big square
= 4 small squares

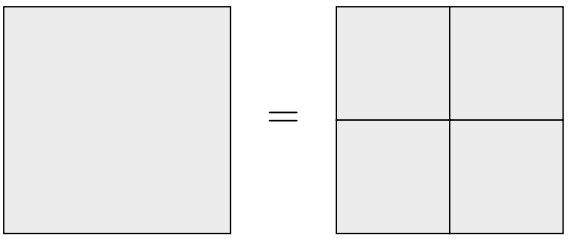

Problem 5: Split exactly three big squares into four small squares each. Choose the three that most reduce the gap between your inside and outside bounds.

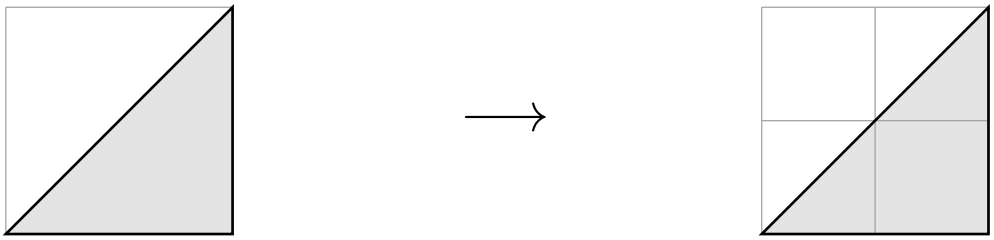

Inside: _____ big-square units

Cover: _____ big-square units

Problem 6: A big square is split into four small squares. Could the total inside area go down? Could the outside-cover area go up? Explain why your answers work for any of these shapes.

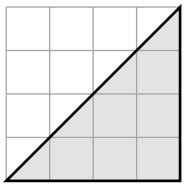

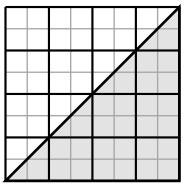

1 big square
= 4 small squares

Problem 7: The original triangle on page 1 fits with a second copy into its 4-by-4 square. Find its exact area. Explain how that area fits between both pairs of bounds you found.

Smaller pictures of the original triangle; not to scale.

Exact area: _____
big-square units
