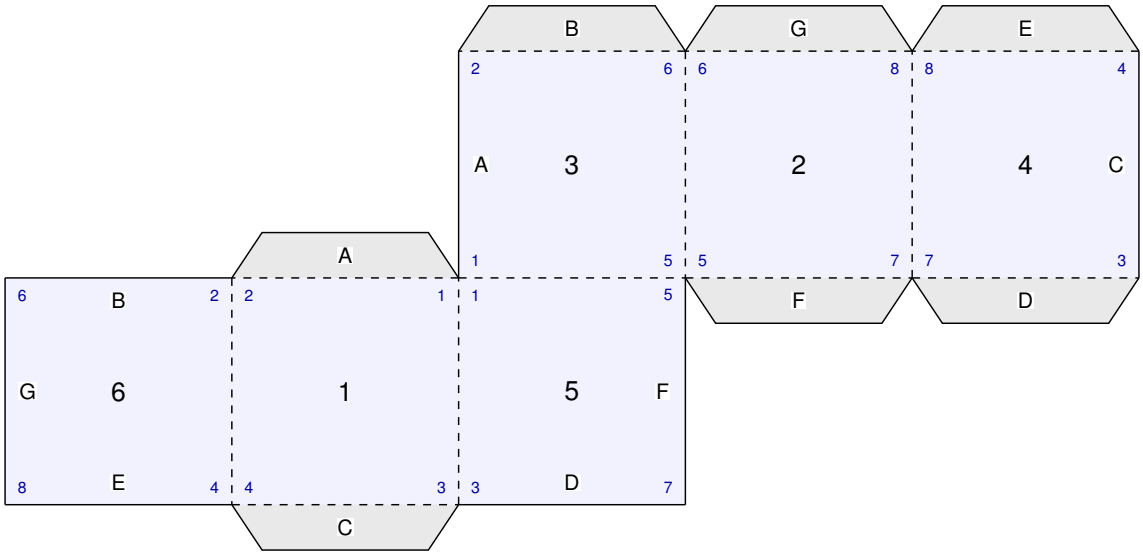
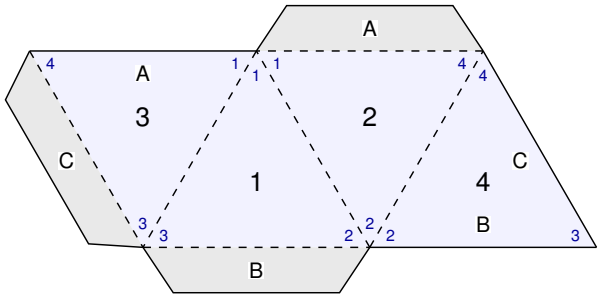
Print at actual size, 100%. Every face edge is 30 mm. Cut solid outside lines; fold dashed lines. Shaded tabs lie outside the faces. Join the two copies of each letter, with the shaded tab inside. Small blue corner numbers must meet matching numbers. Large numbers identify faces. Close every face.

30 mm check

**Cube: six square faces**

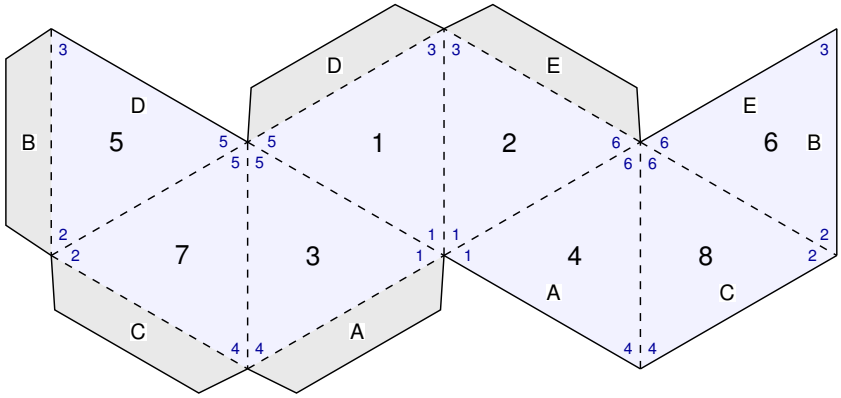


**Tetrahedron: four equilateral triangle faces**

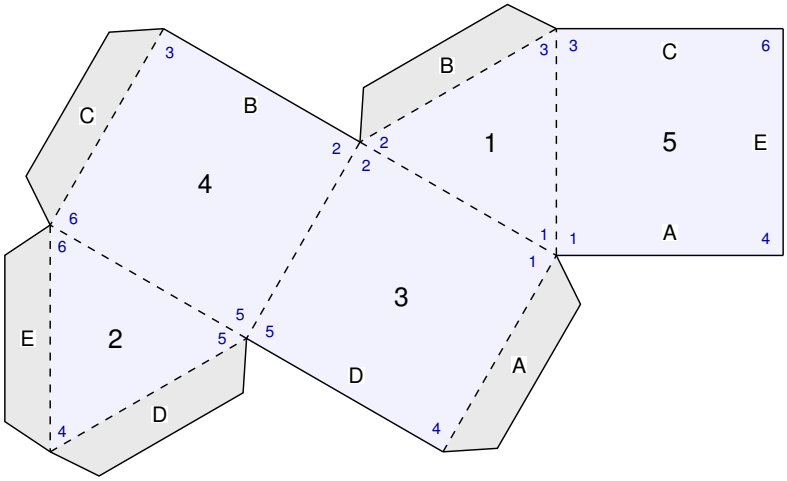


Every face edge is 30 mm. Cut solid outside lines, fold dashed lines, join matching letters and blue corner numbers. Tabs do not count as faces.

**Octahedron: eight equilateral triangle faces**

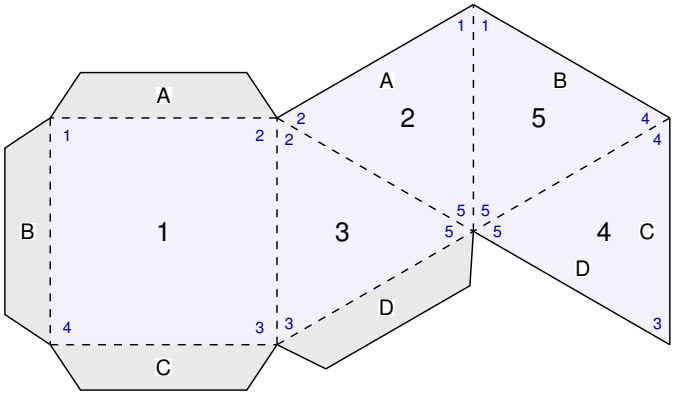


**Right triangular prism: two equilateral triangles and three squares**



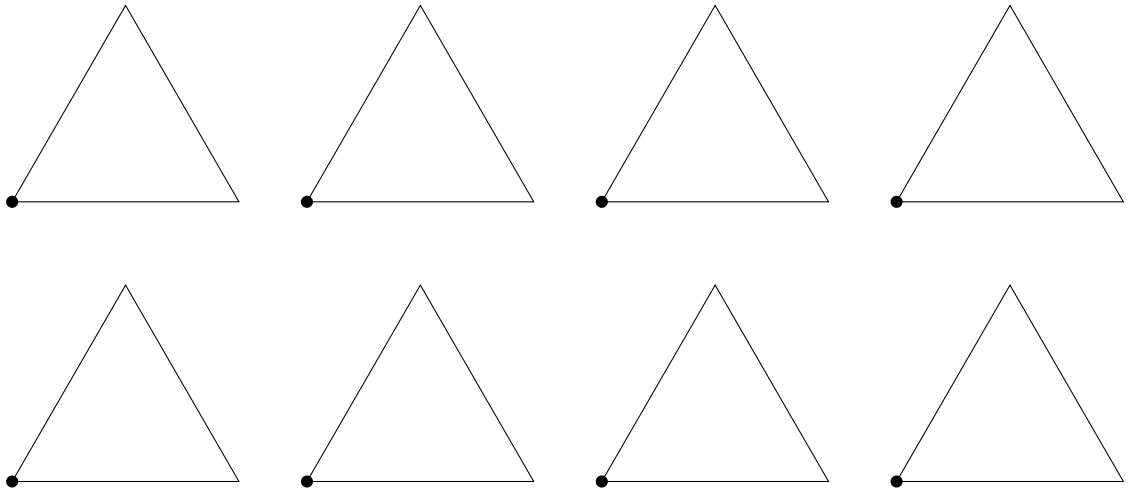
Every face edge is 30 mm. Cut solid outside lines, fold dashed lines, join matching letters and blue corner numbers. Tabs do not count as faces.

### Square pyramid: one square and four equilateral triangles



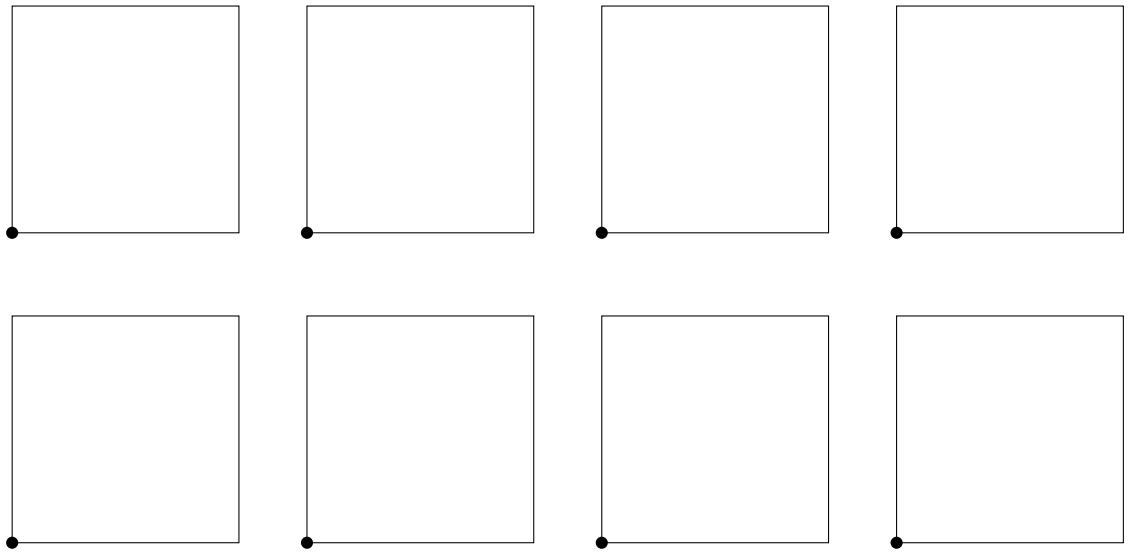
### Equilateral triangle faces for corner fans

Cut eight triangles. The black dot marks the corner to put at the center of a fan. Tape adjacent sides together; preserve each face's shape. These have no glue tabs.



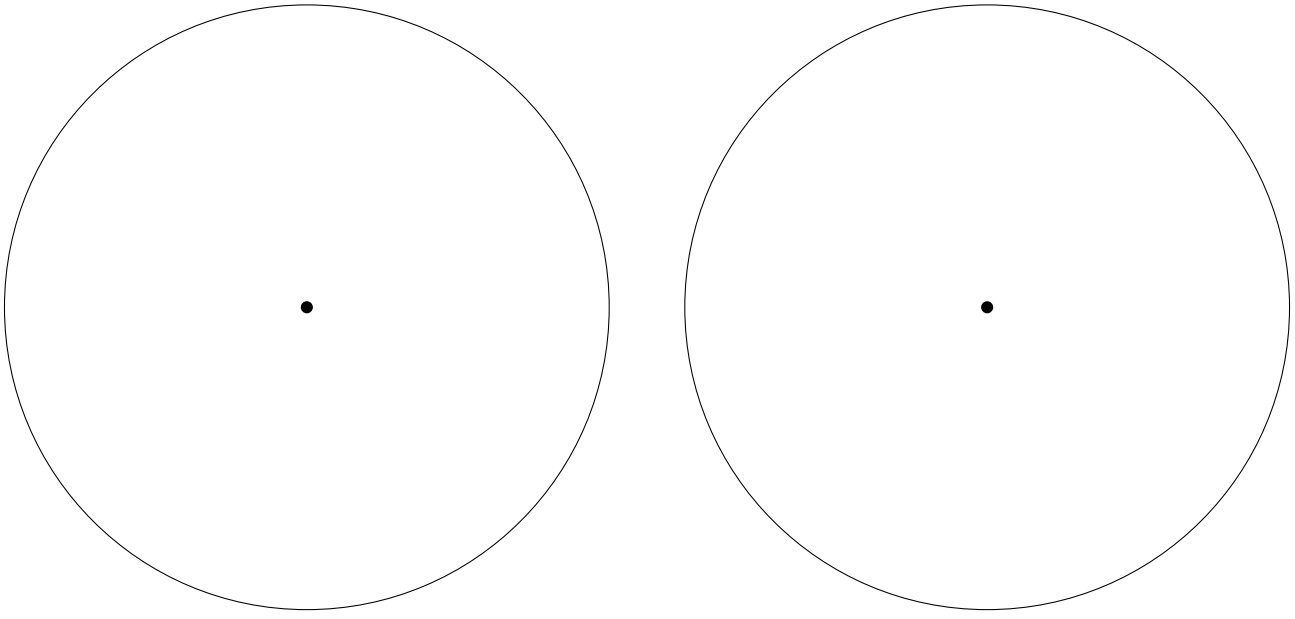
### Square faces for corner fans

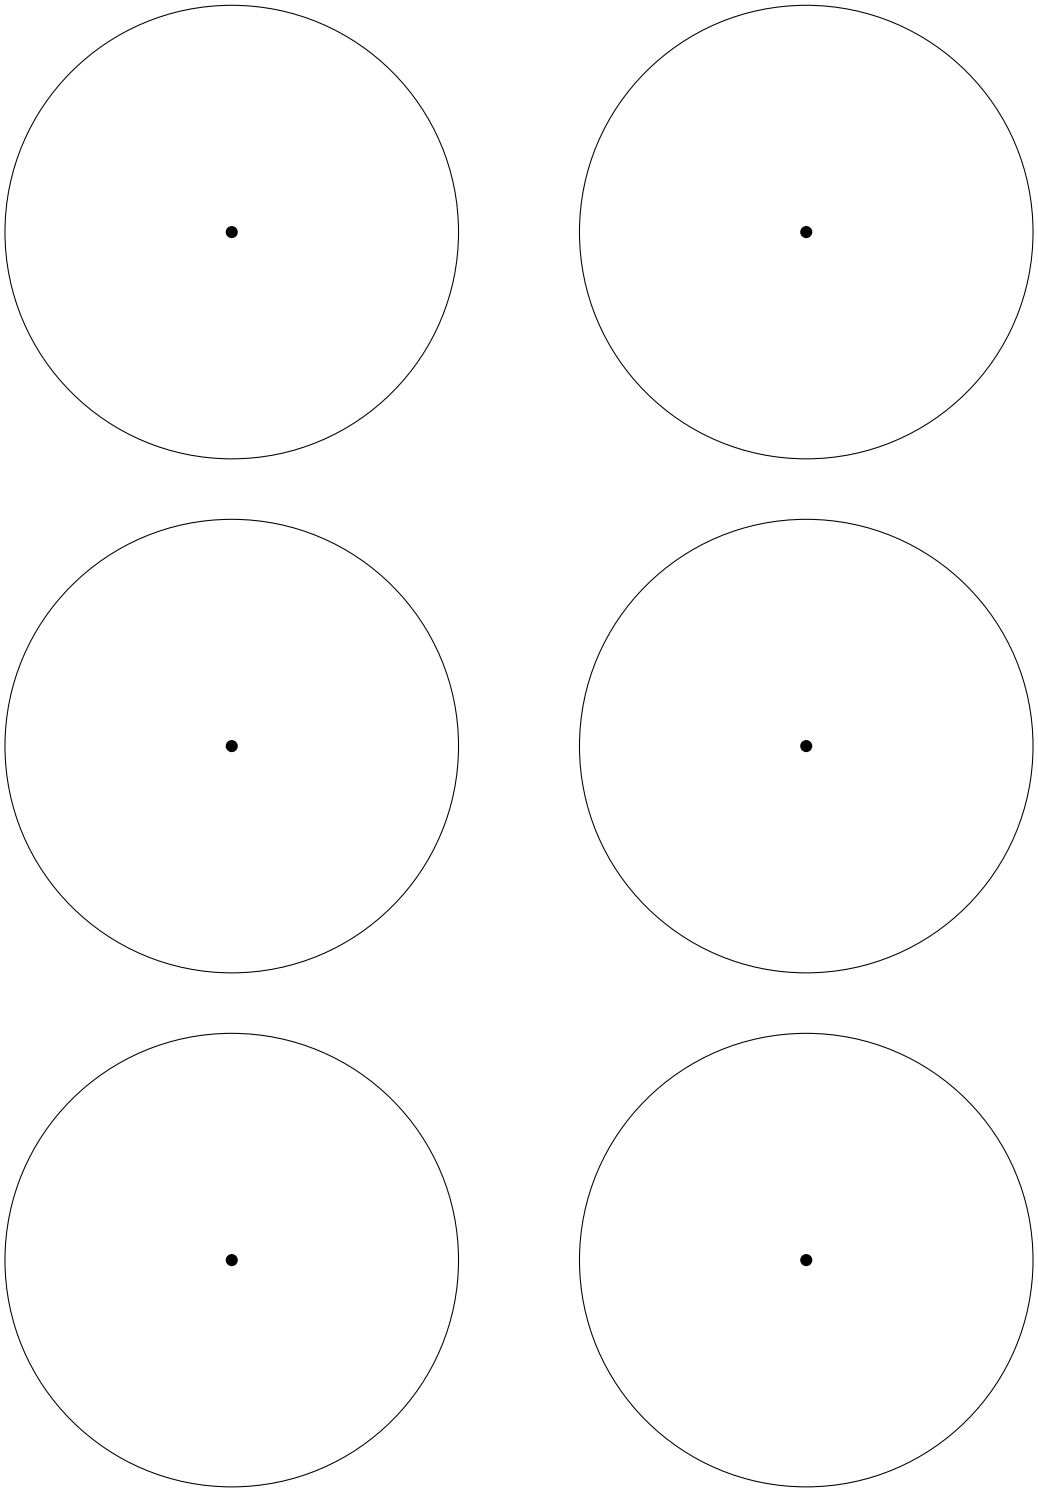
Cut eight squares. Every edge is 30 mm. The black dot marks the corner to put at the center of a fan. These have no glue tabs.



### Full-turn circles

Cut two circles, each 80 mm across. Lay fan corners around the center dot to see the missing part of a turn.



**Gap circles for copying gaps**


Cut six circles, each 60 mm across: from the center to the rim is one face edge, 30 mm. To copy the gap at one corner of a solid, lay that corner's face pieces flat on a circle with their dots on its center dot, draw along the two free sides out to the rim, and cut along those two lines. The piece with no face on it is the gap copy. A younger pair uses 14 circles: 8 for the cube's corners, 4 for the tetrahedron's, and 2 for the pyramid's top and one base corner.
