Move a pawn on the roads. Keep each journey as ordered step tiles. Two adjacent steps along the same road in opposite directions are an out-and-back pair. Remove only out-and-back pairs, and replay the other steps in order. The map, start, and finish stay fixed.

input

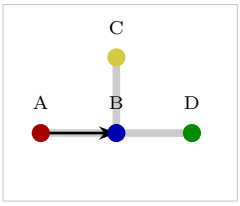

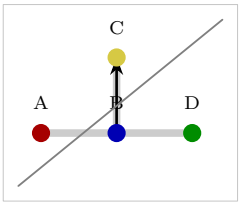

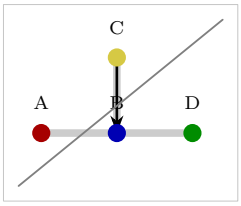

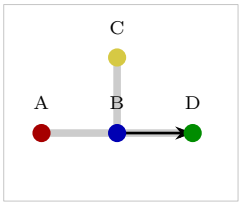

$A \to B \to C \to B \to D$

remove

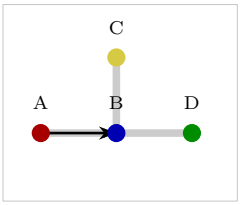

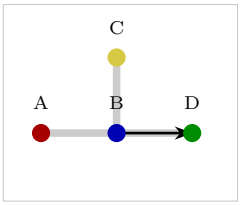

output

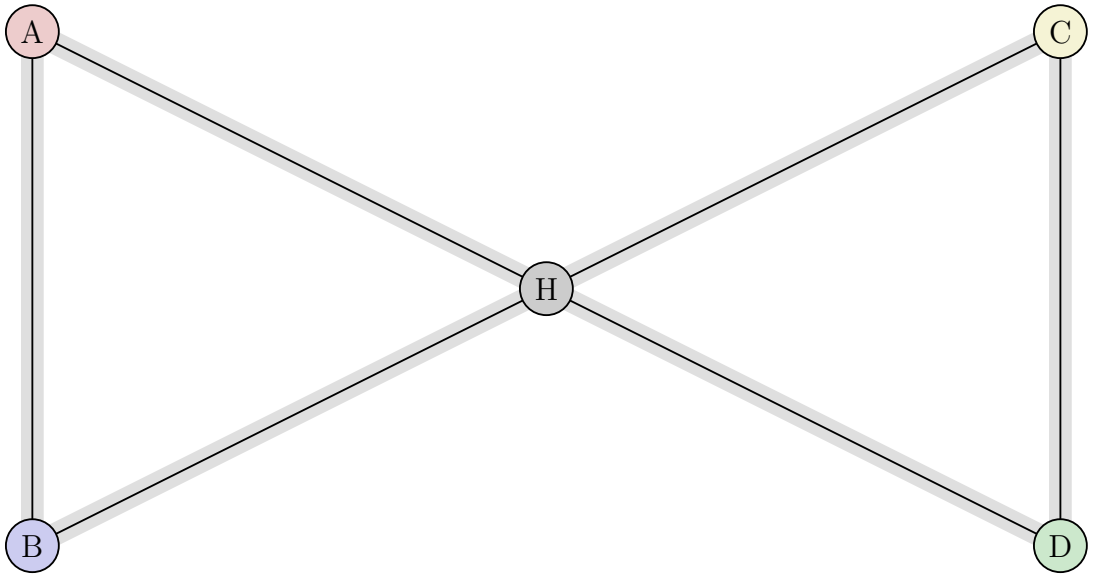

$A \to B \to D$

No steps left means the pawn stays at its start.

Problem 5: Left forward is H to A to B and back to H, and right forward is H to C to D and back to H. From H, go left forward, right forward, left backward, then right backward. Can the whole trip disappear by removing out-and-back pairs?

Problem 6: Join the same four ring trips in every possible order. Which orders disappear?
