Move a pawn on the roads. Keep each journey as ordered step tiles. Two adjacent steps along the same road in opposite directions are an out-and-back pair. Remove only out-and-back pairs, and replay the other steps in order. The map, start, and finish stay fixed.

input

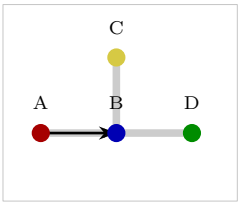

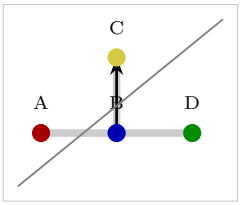

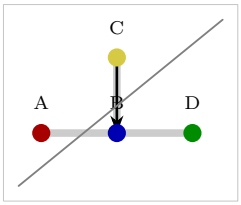

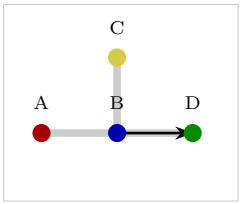

$A \to B \to C \to B \to D$

remove

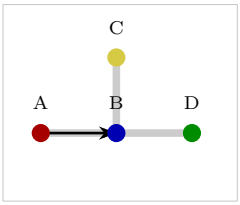

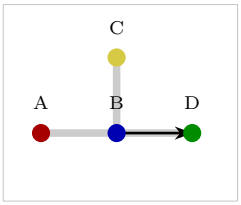

output

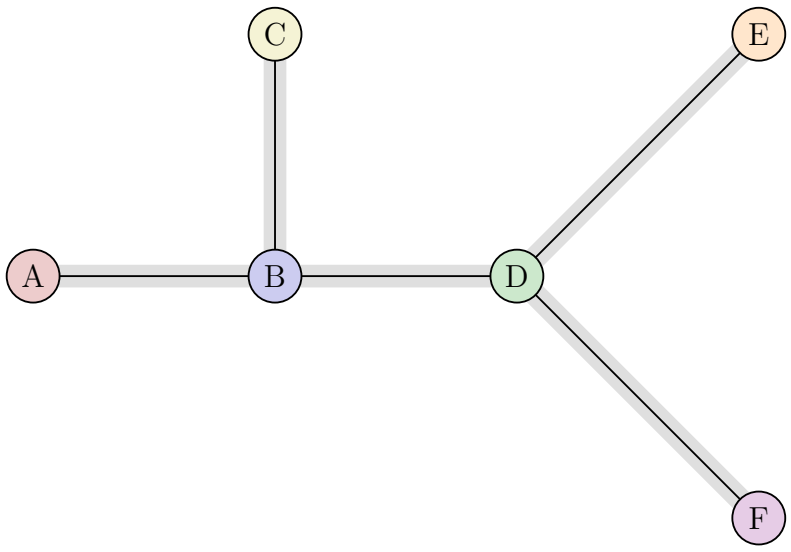

$A \to B \to D$

No steps left means the pawn stays at its start.

Problem 1: Make a three-step trip from A to E and four-step trips from B back to B and from A to D. Make each one as a row of step tiles, then shorten it as much as you can.

Problem 2: Make four-step trips from A back to A on this ring. Which can you shorten to staying at A, and which keep some steps?
