Problem 2: What is the longest possible boundary of a twelve-tile shape? Explain why no shape can have a longer boundary. Draw three shapes reaching that length, none of them a straight row. Can such a shape contain a 2-by-2 block? Can it have a hole? Two tiles that touch at a corner leave no gap between them.

Boundary: _____

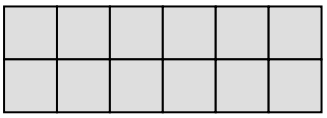

Boundary: _____

Boundary: _____

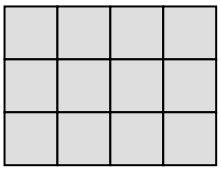

Problem 3: Count the occupied rows, occupied columns, and boundary sides of each shape.

Rows: ____

Columns: ____

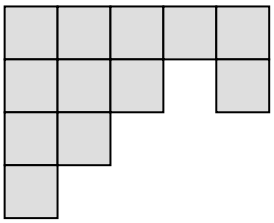

Boundary: ____

Rows: ____

Columns: ____

Boundary: ____

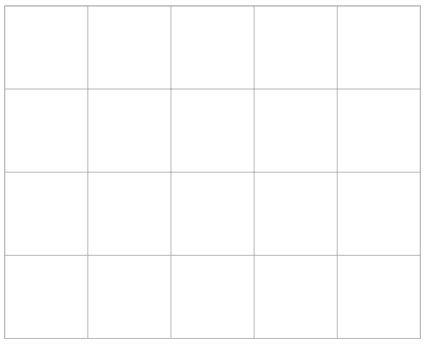

Rows: ____

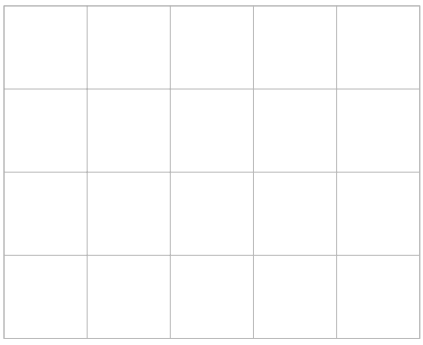

Columns: ____

Boundary: ____

Make two twelve-tile shapes that each occupy 4 rows and 5 columns but have different boundary lengths. What is the least possible boundary length for a shape occupying 4 rows and 5 columns? Explain.

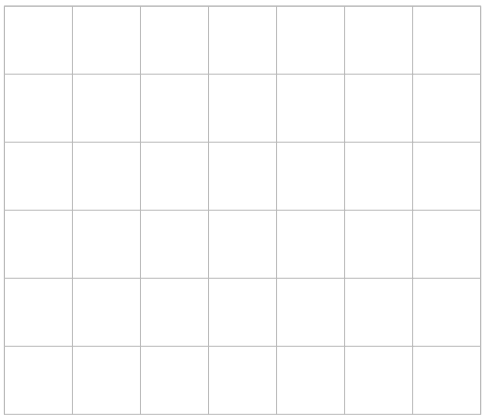

Boundary: _____

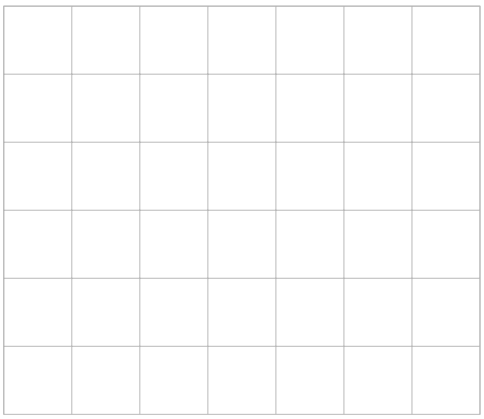

Boundary: _____

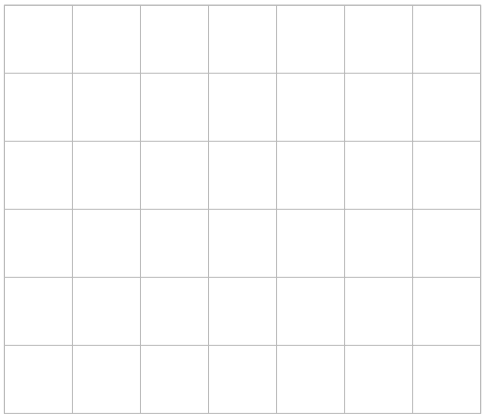

Problem 4: For each boundary length shown, find the greatest number of tiles a shape can have. Explain why no shape with that boundary length can contain more tiles.

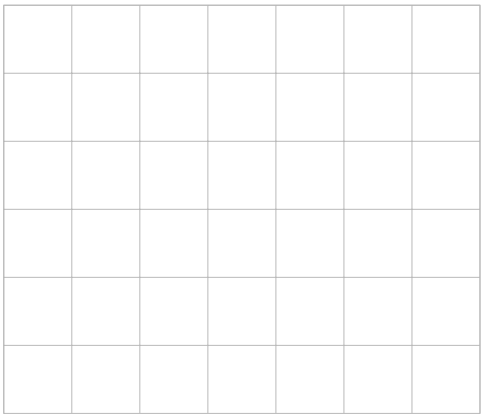

Boundary: 12; tiles: _____

Boundary: 14; tiles: _____

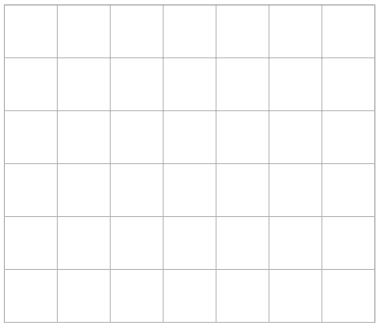

Boundary: 16; tiles: _____

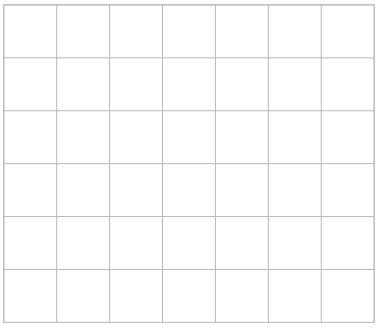

Boundary: 18; tiles: _____

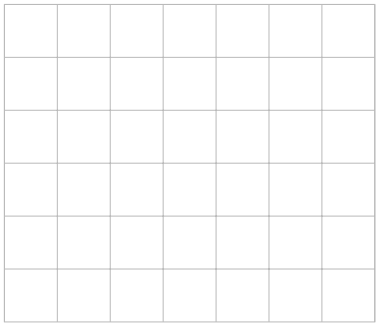

Problem 5: Find the shortest possible boundary for shapes with 12, 13, 17, 20, and 21 tiles. Explain why each of your shapes has the shortest possible boundary.

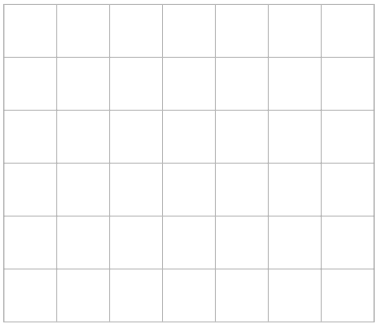

12 tiles; boundary: _____

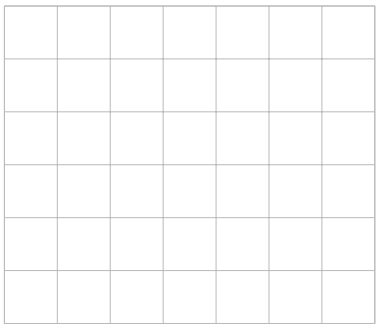

13 tiles; boundary: _____

17 tiles; boundary: _____

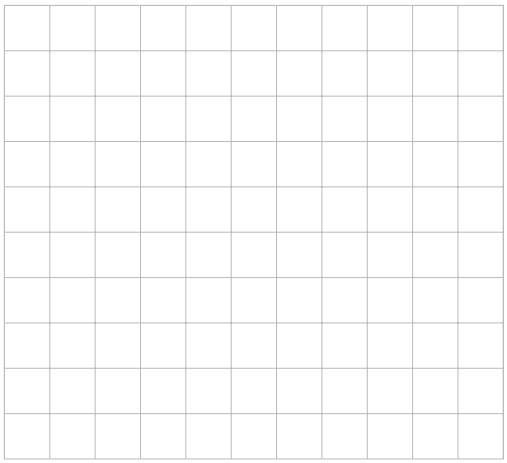

20 tiles; boundary: _____

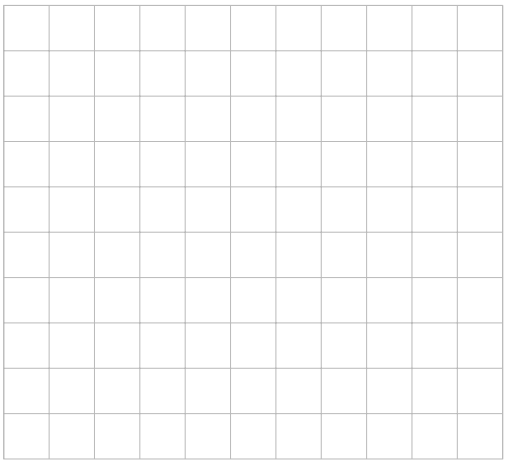

21 tiles; boundary: _____

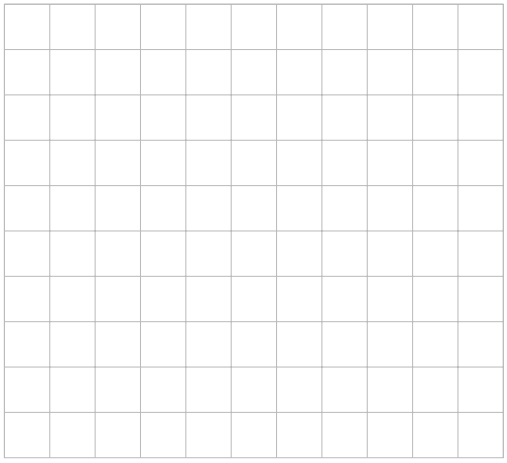

Problem 6: Give a rule for the greatest number of tiles in a shape with any even boundary length of at least 4. Explain why your rule works. Use it to find the shortest possible boundaries for shapes with 37, 50, and 73 tiles, and draw shapes that reach them.

37 tiles; boundary: _____

50 tiles; boundary: _____

73 tiles; boundary: _____
