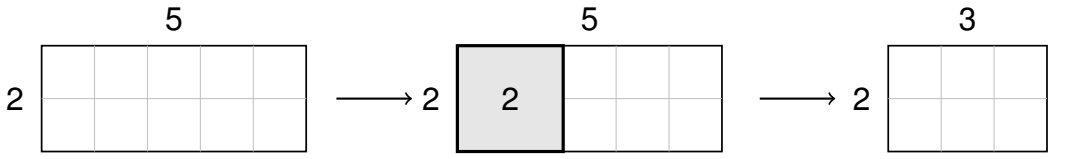
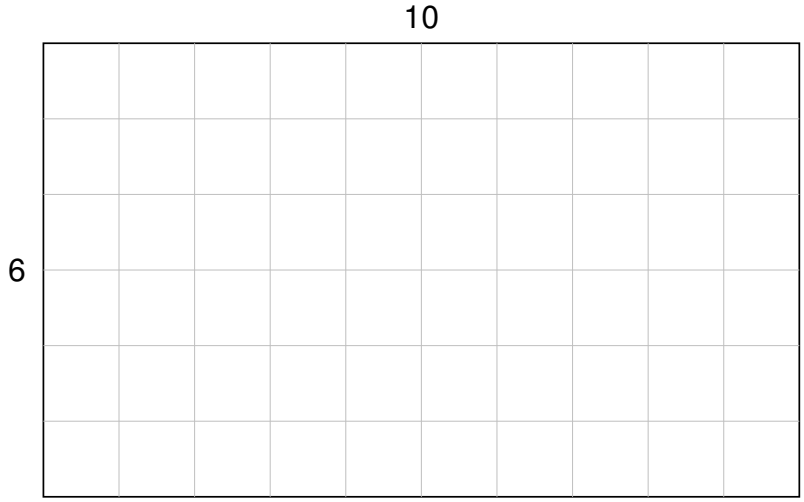
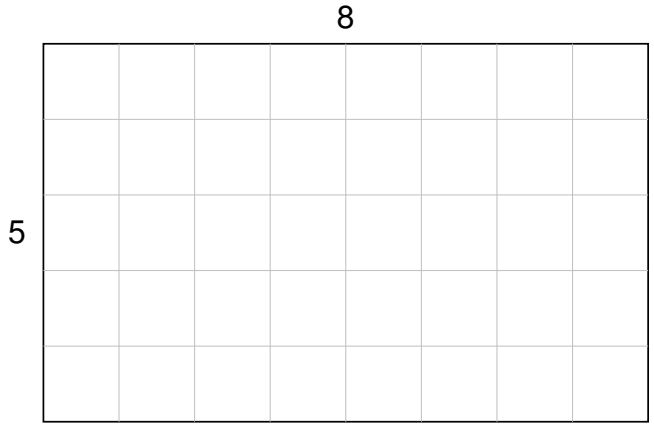
Keep square edges on grid lines. Cover rectangles with no gaps, overlaps, or overhang. For the biggest-square rule, cover the largest square at one end, then repeat on the rectangle left over.

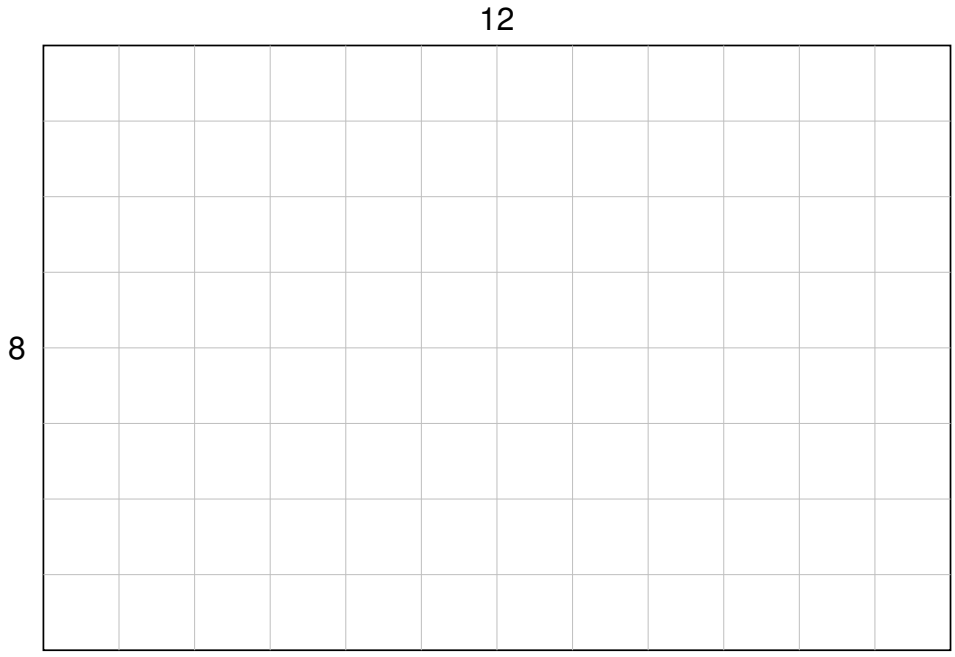


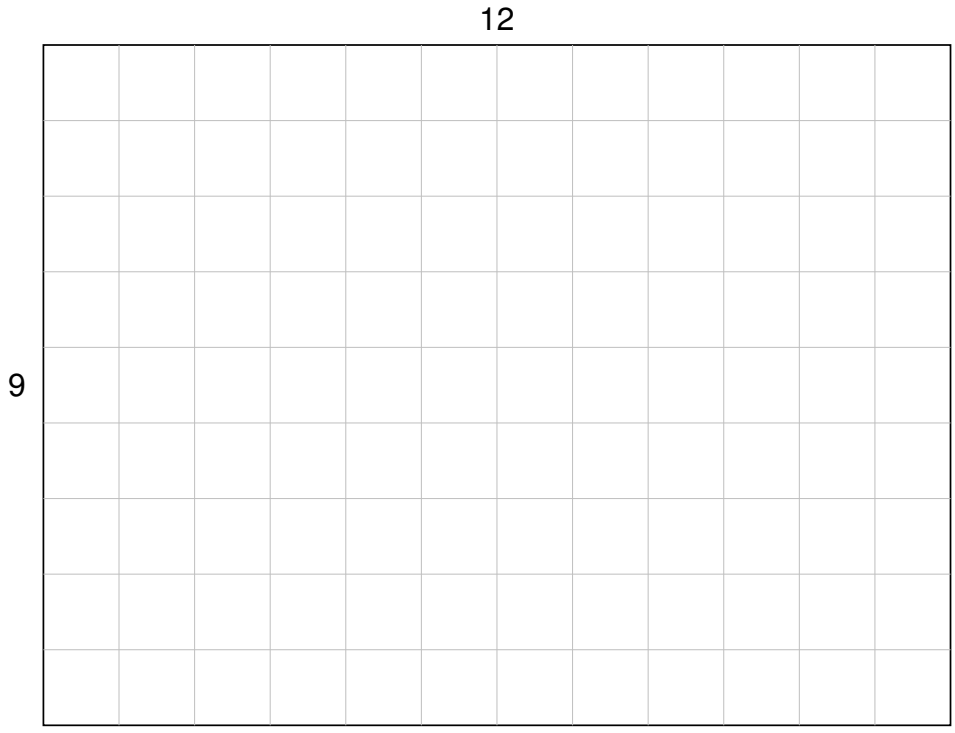
Problem 1: Use the biggest-square rule on both rectangles. Record the square sizes in the order you use them.



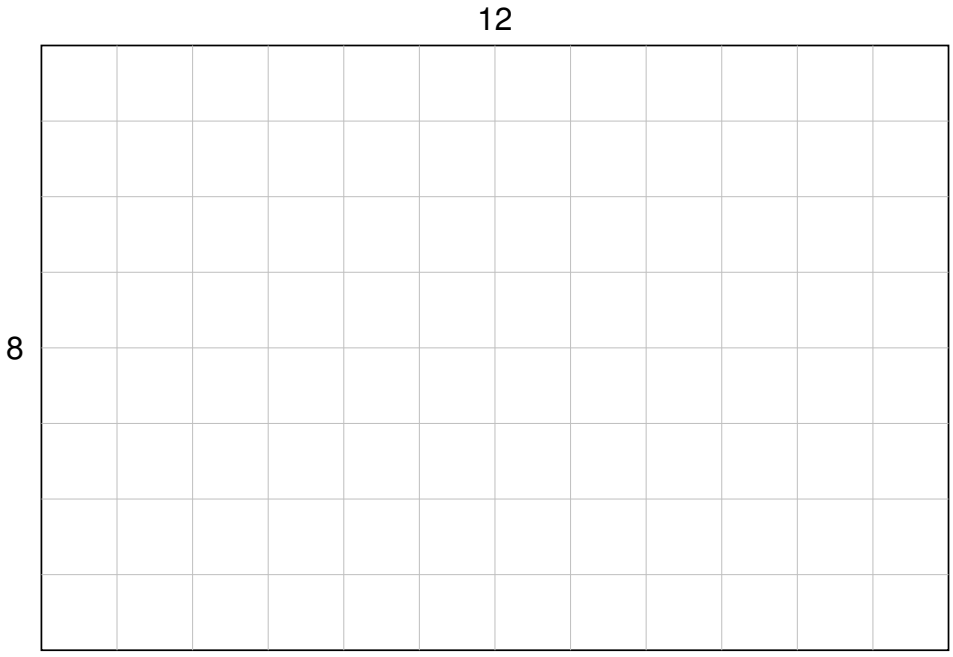


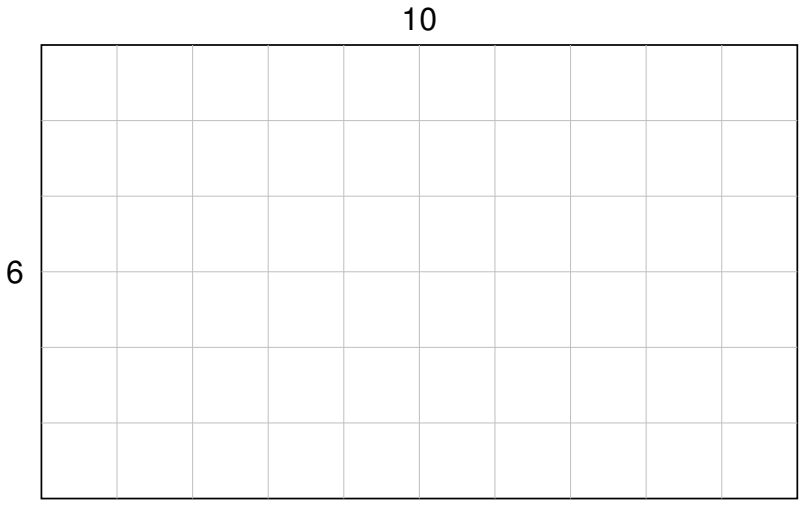
Problem 2: Try the biggest-square rule on these rectangles. How does changing one side change the last square?



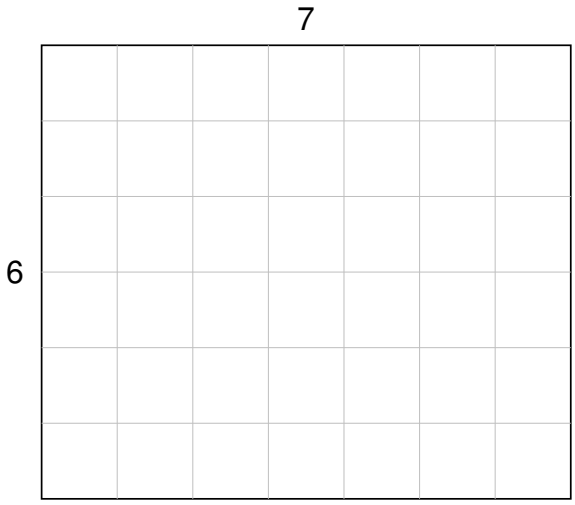


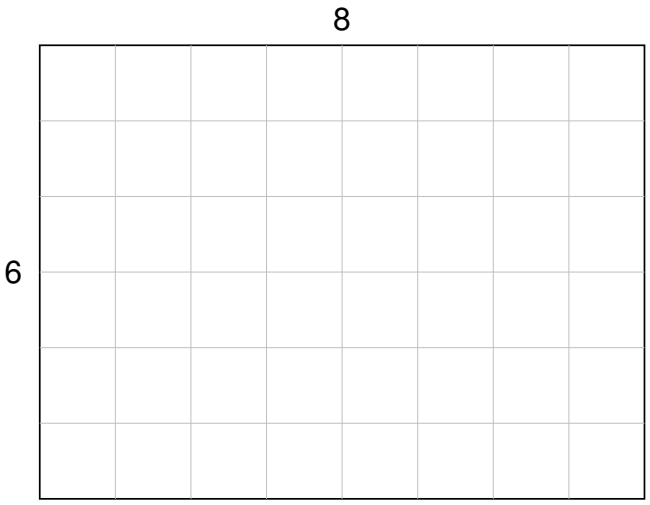
Problem 3: Cover each rectangle with identical squares. Find every whole-number square size that works, and decide which is biggest.

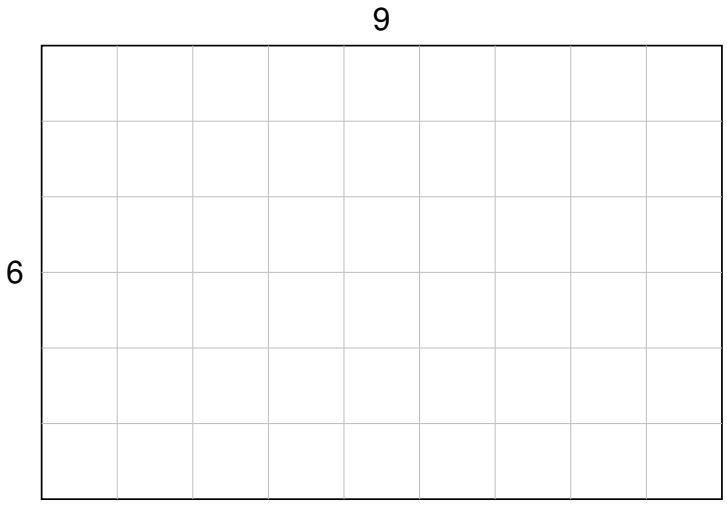




Problem 4: Try the biggest-square rule on these rectangles. Predict the last square for a 6 by 10 rectangle and explain your prediction.







Problem 5: How is the last square from the biggest-square rule related to the biggest identical squares that can cover the original rectangle? Explain using a rectangle you have tried.

Problem 6: Make three rectangles with different first squares and the same last square of side 3. Use only side lengths 3, 6, 9 and 12.
