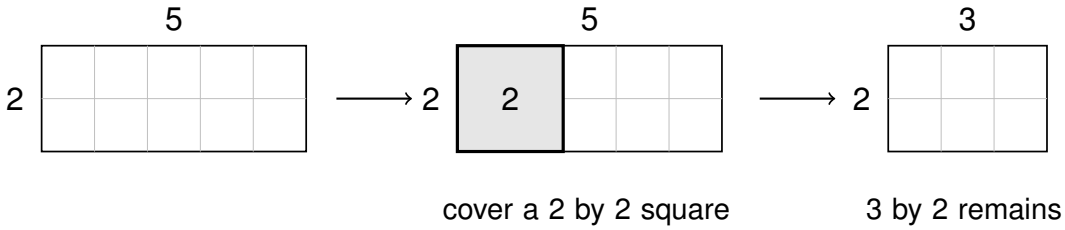
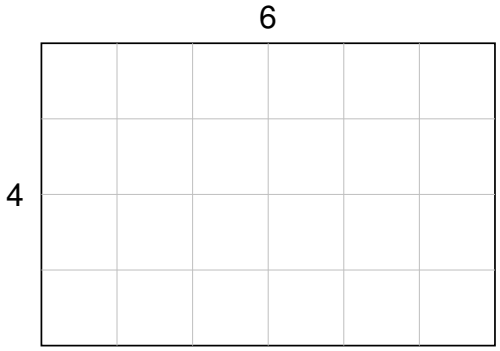
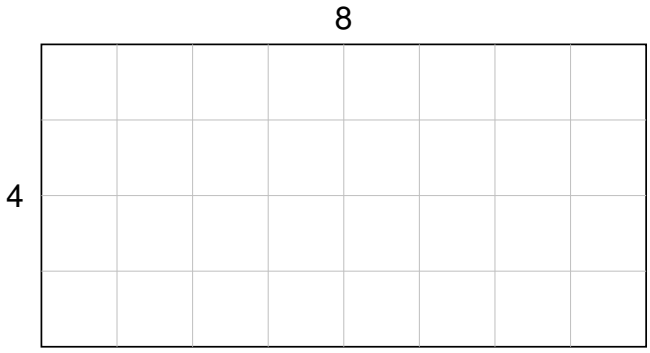
Keep square edges on grid lines. Cover rectangles with no gaps, overlaps, or overhang. For the biggest-square rule, cover the largest square at one end, then repeat on the rectangle left over.

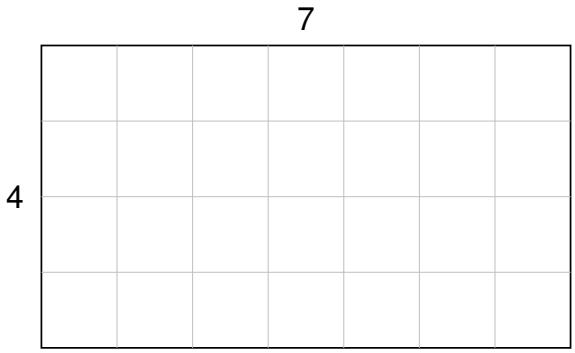


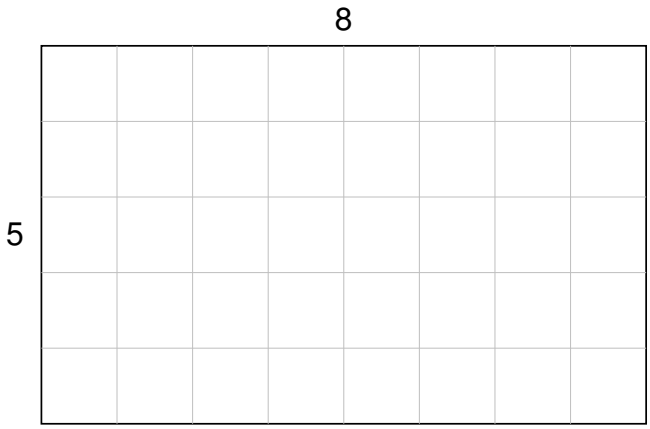
Problem 1: Cover both rectangles with the biggest-square rule. Which square comes last?



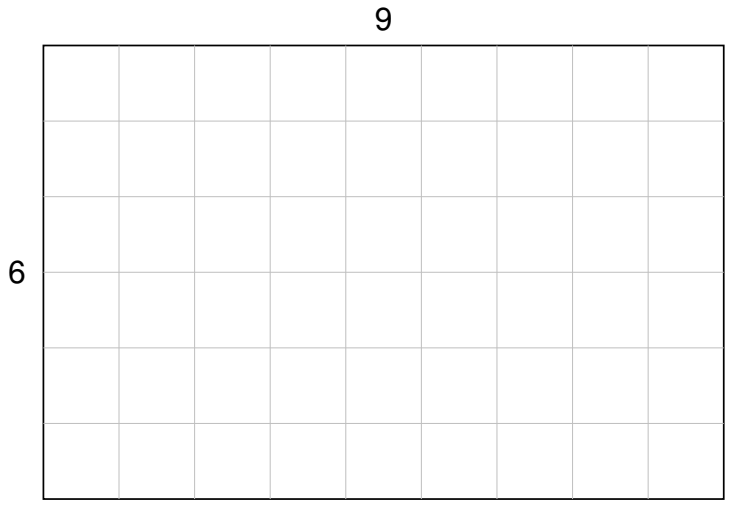


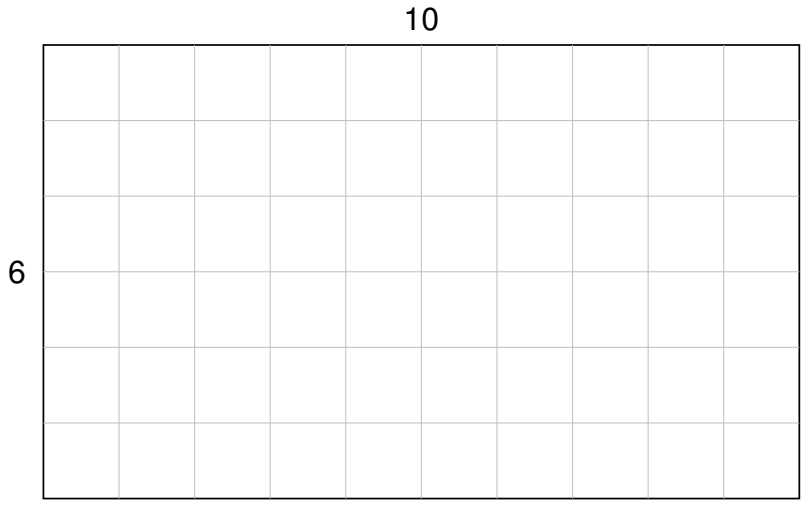
Problem 2: Will the last squares match? Use the biggest-square rule on both rectangles.



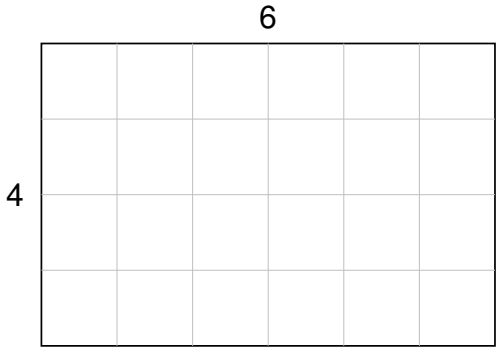


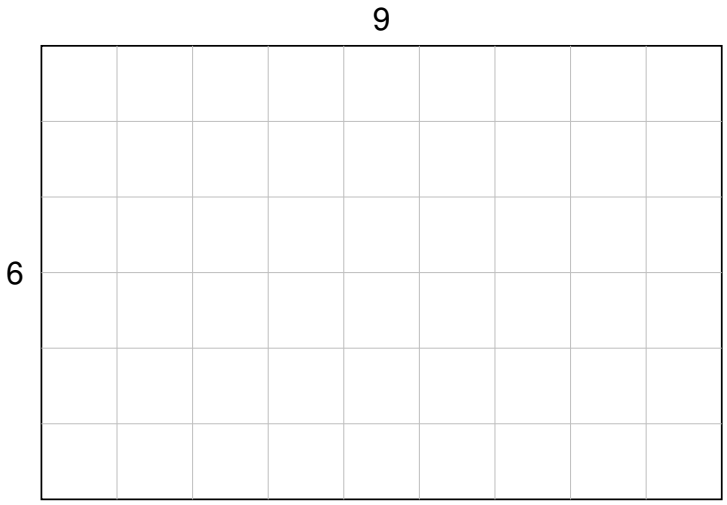
Problem 3: Try the biggest-square rule on these rectangles. Will they end with the same size square?

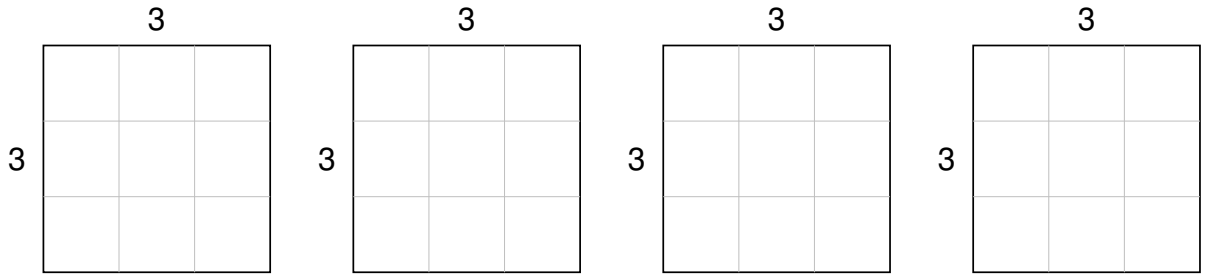




Problem 4: Cover each rectangle with squares that are all the same size. Find the biggest square size that works.







Problem 5: Find every rectangle you can make with four 3 by 3 squares, counting turns as the same shape. Will their last squares match under the biggest-square rule?
