For random draws, use the same bag. Every counter has the same chance each time; put it back and mix after each draw.

Red, then blue makes this pair. Keep the order.

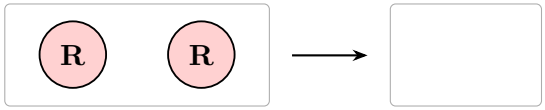

Problem 1: Choose draws yourself to make every different color pair. Which pairs disappear if you take the blue counter out of the bag?

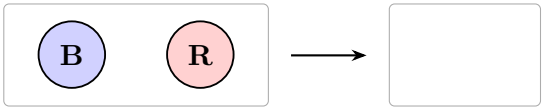

Use three red counters and one blue again. A rule gives each color pair a square, a circle, or no shape. The same color pair always gets the same answer.

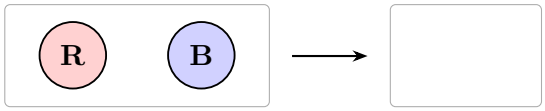

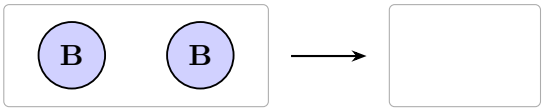

A sample rule: BR gives a square.

Problem 2: Make a rule that sometimes gives each shape and gives them the same chance. Try it on six random pairs.

Use a cross to record no shape.

The red counters have marks R1, R2, R3. Each marked pair below has the same chance.

Problem 3: Does your rule give each shape to the same number of pictures? Find every rule that does and sometimes gives each shape.
