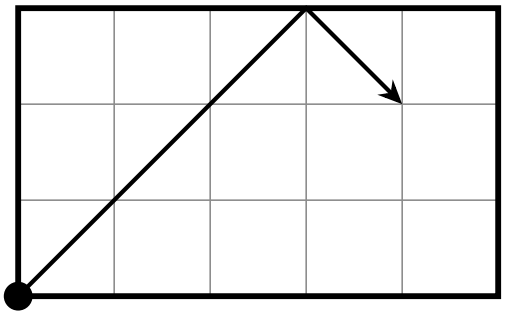
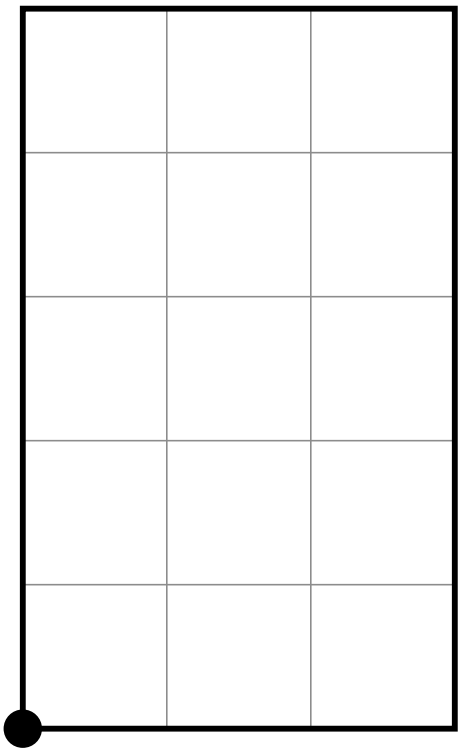
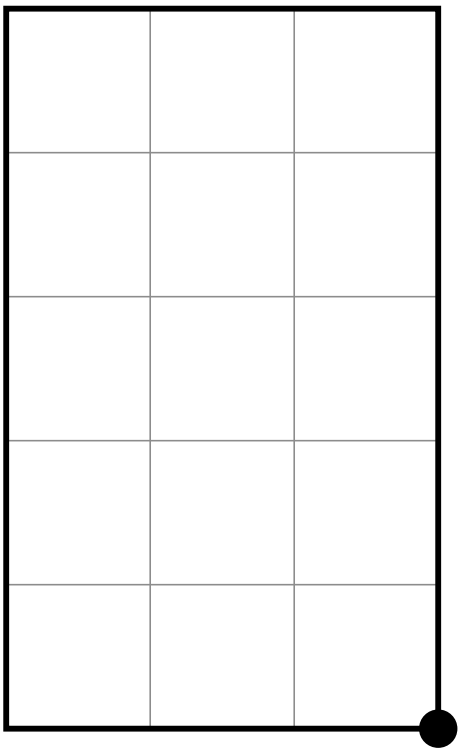
The ball rolls on a table. It starts at the dot and rolls across the squares from corner to corner. It bounces off the walls and stops when it gets to a corner of the table. Each time it hits a wall is one bounce. Stopping at the corner is not a bounce.



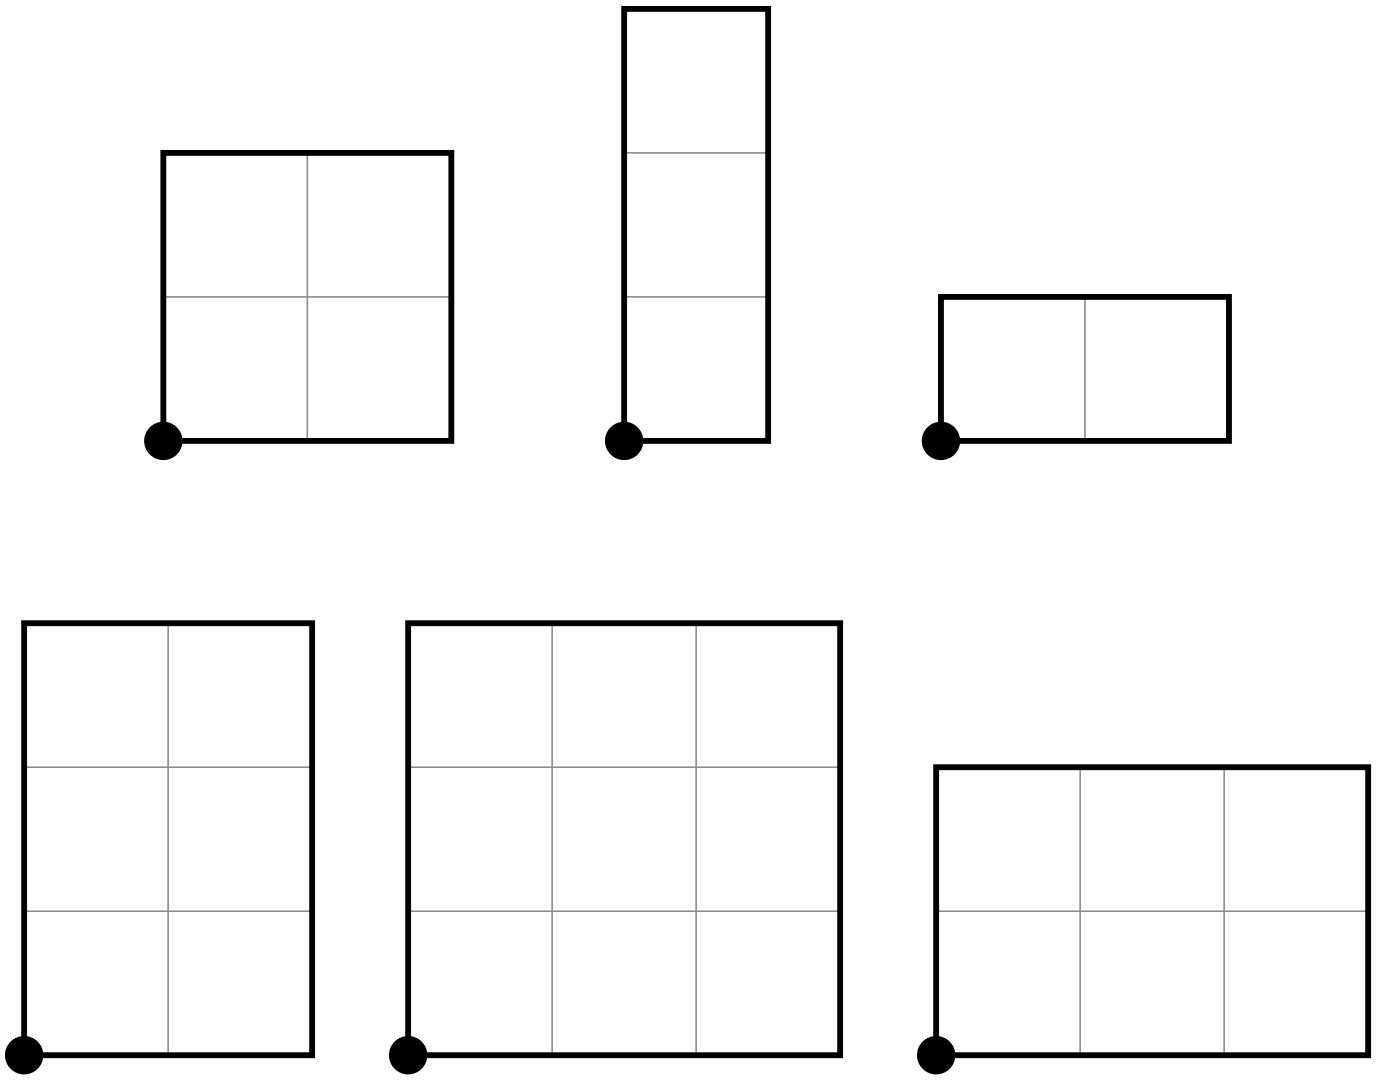
Partners take turns. One puts a counter on the corner where they think the ball will stop, and the other moves a counter along the path and draws it with a crayon.

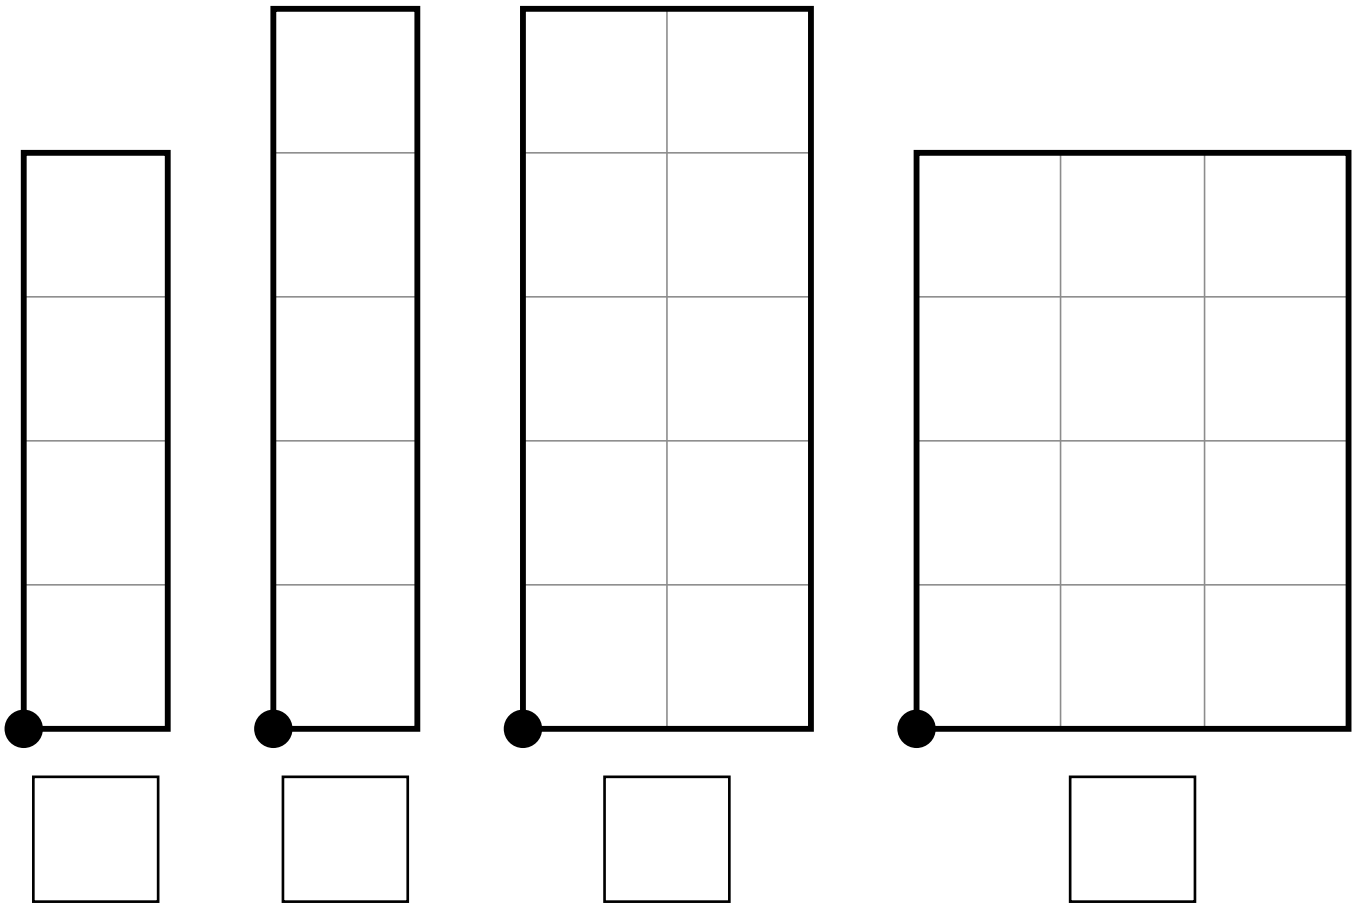
Problem 1: Take turns walking as the ball on the floor grid. Walk once from each dot, and draw each walk.





Problem 2: Where does the ball stop on each table? Draw its path.





Problem 3: How many times does the ball bounce on each table? Write the number in the box.
