One turn: move every block down its own arrow. Then slide the bottom row straight up into the top row. When you draw a machine, give every top slot one arrow going out and every bottom slot one arrow coming in.

Problem 5: Can you draw a machine where only one block ends up in a different slot? Try each drawing with the blocks, and if it can't be done, explain why.

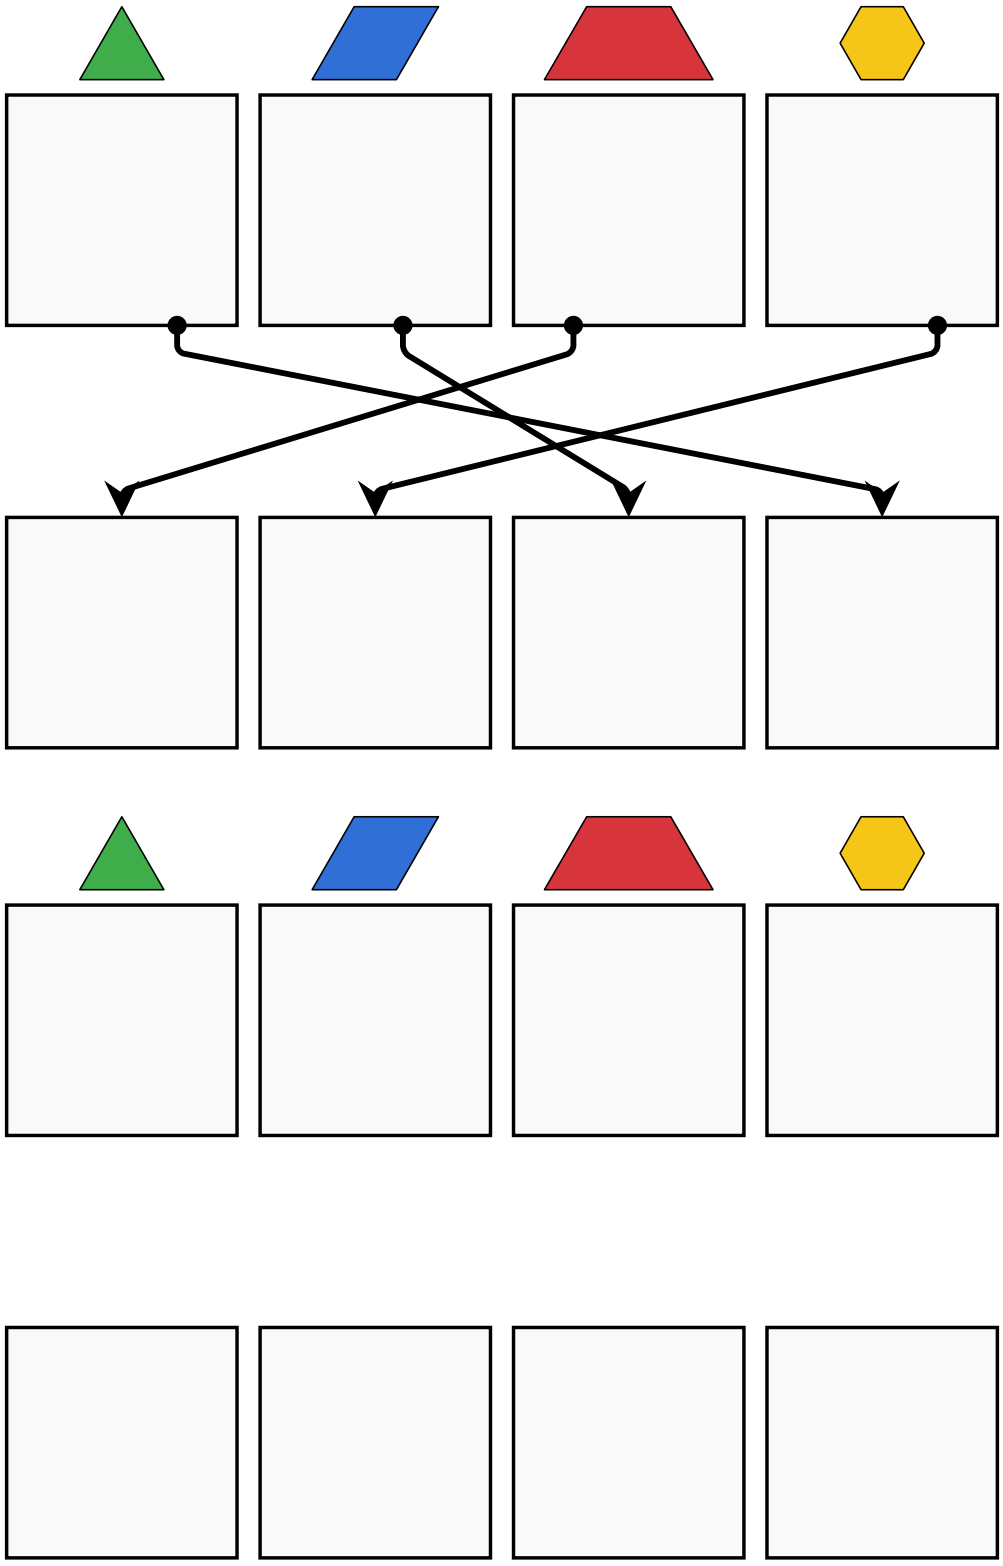

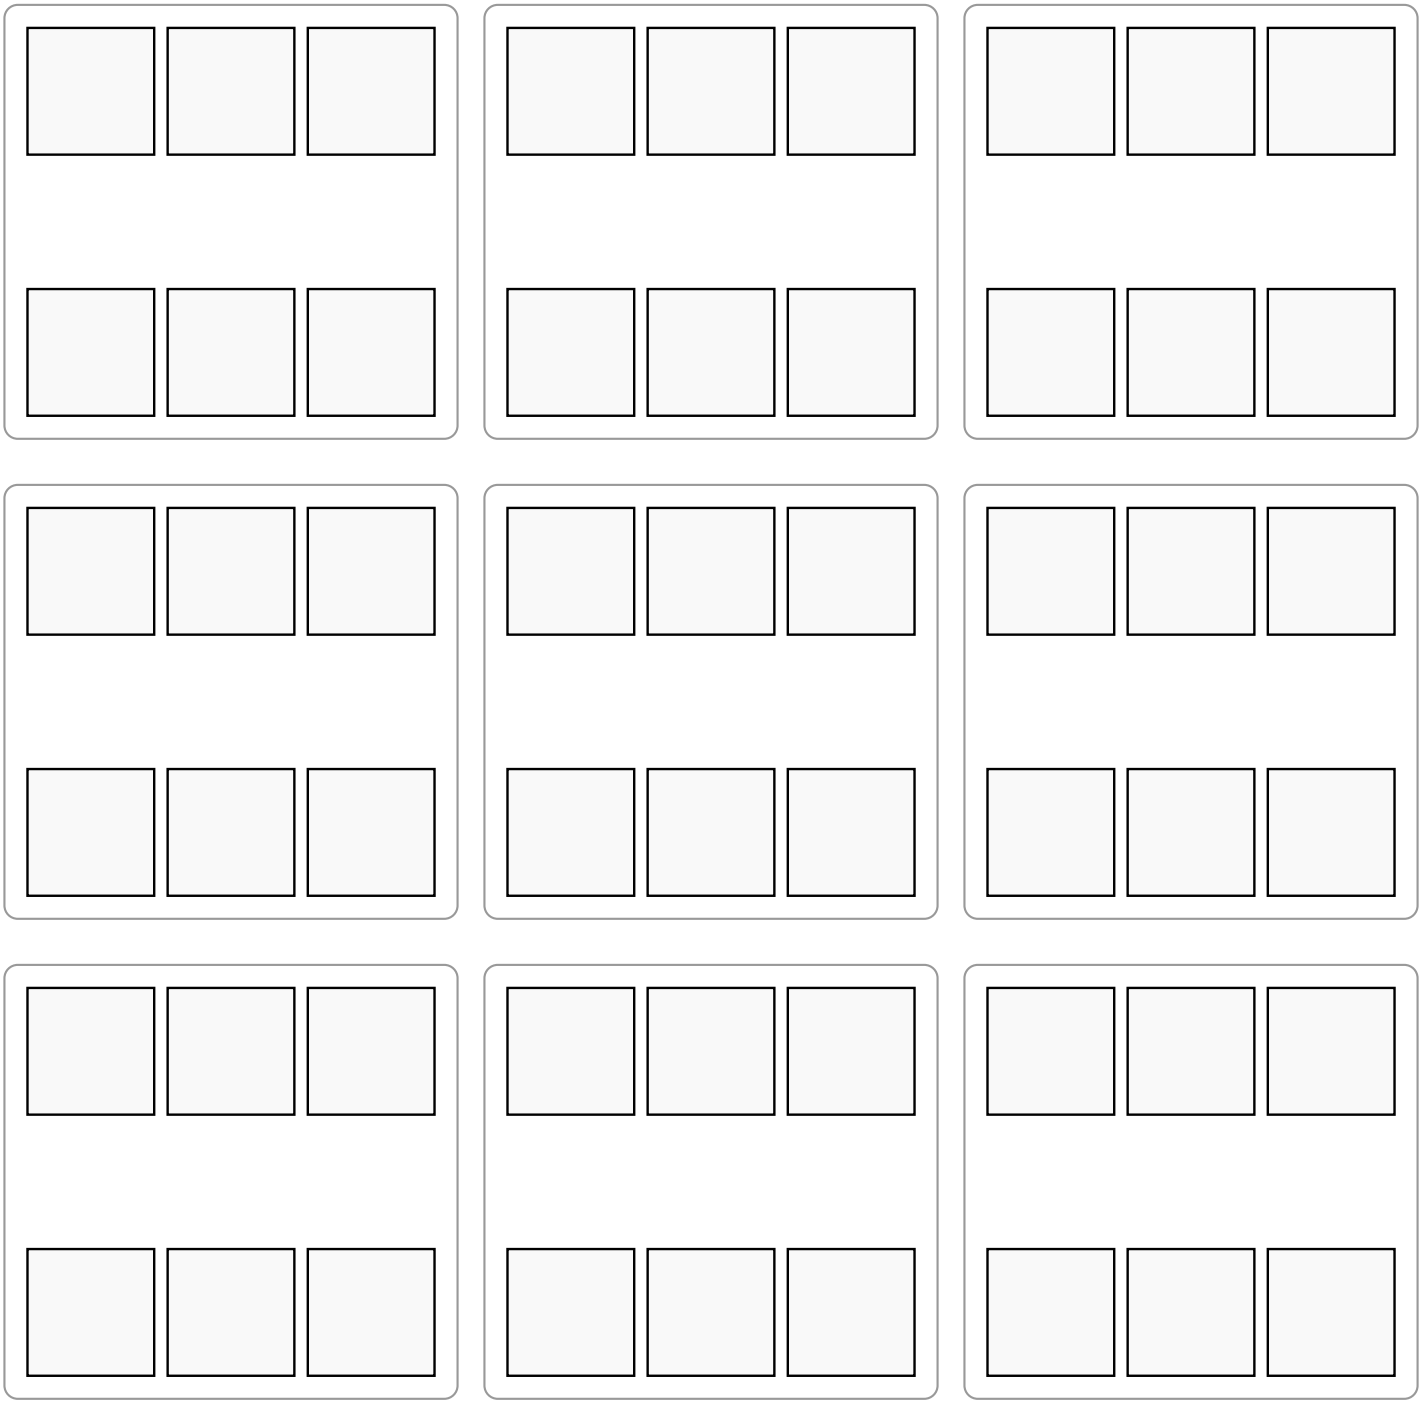

Problem 6: Put each block under its picture on the first machine and do one turn. Move the row of blocks to the second machine without changing its order. Draw arrows on the second machine so one more turn puts every block back under its own picture.

Problem 7: Draw all the different machines with 3 slots. How many are there?

Problem 8: Each partner draws a new machine with 5 slots that takes 6 turns, not the one in Problem 3. Check each other's machines with the blocks.
