Add the numbers joined to a circle and divide by how many numbers you added. The answer must equal the circle's number. Squares keep their numbers. Every circle must work at the same time.

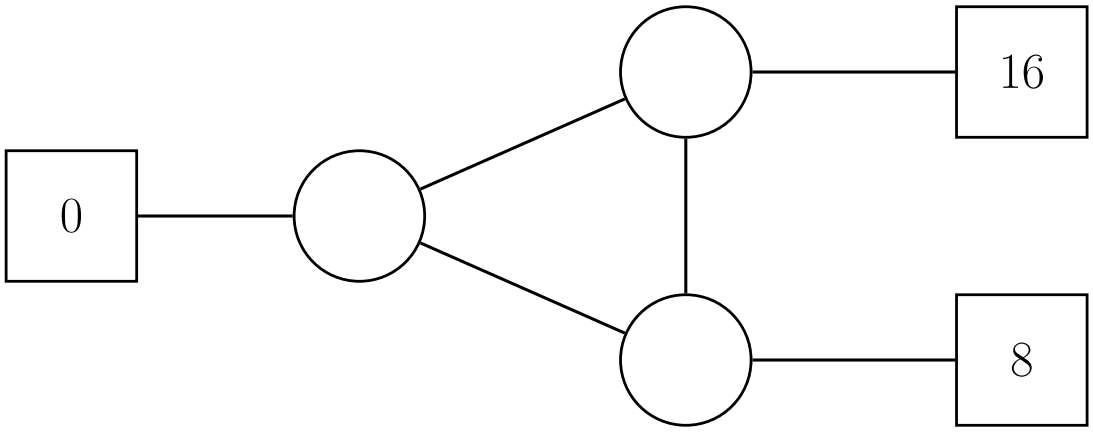

Problem 4: Fill the circles. Which circles can equal the largest square number on their own board? Explain what makes the two boards different.

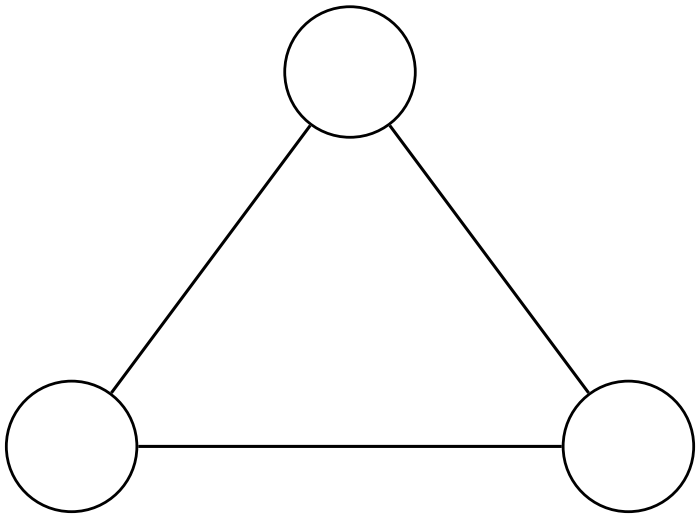

Problem 5: Can the same board, with the same square numbers, have two different fillings that both follow the rule? Explain your answer for every finite board where each shape can reach a square.

Problem 6: Use whole numbers from 0 to 4. Find every filling of the upper board and of the lower board. How many fillings does each board have? Explain why none are missing.

Problem 7: Which boards can you fill with whole numbers? Fill the other boards using the fraction cards.
