A route goes straight from its start dot to one point on the line, then straight to its finish dot. Touch between the end marks. Do not travel along the line. Use the dot centers.

Problem 1: Find the shortest routes from A to B and from A to C. Decide which of your two routes is shorter.

Problem 2: Make routes from A to B and from A to C that touch the line at the same point. Could moving that point make one route longer than the other? Explain for every possible contact point.

Problem 3: Find the shortest route from A to B. Explain why no other allowed route is shorter, including routes you have not drawn.
