Each circled number counts the counters in its whole row or column. Put at most one counter in a cell. Two pictures are different if any cell is different.

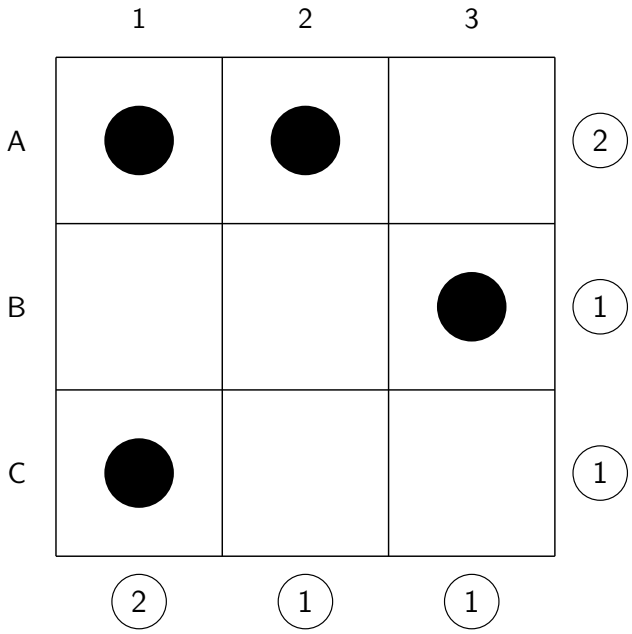

Problem 4: A switch moves the two counters to the empty corners shown; every other cell stays fixed. The corners may use any two rows and columns. Find every switch in each picture and draw its rectangle. Which pictures have none?

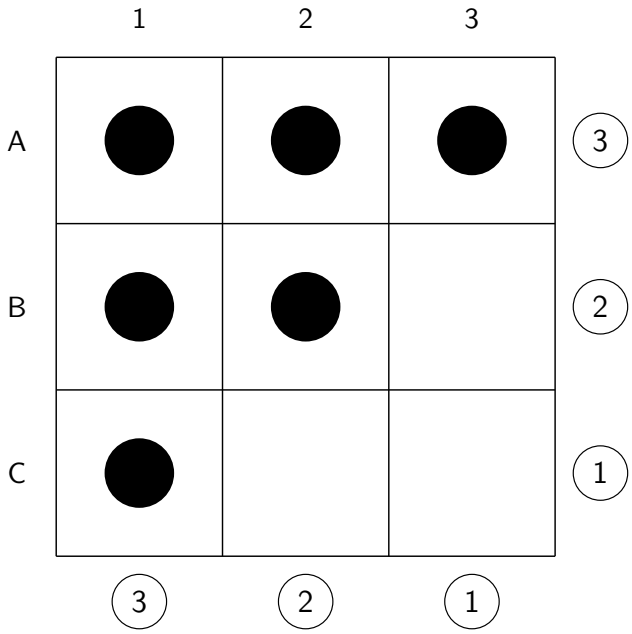

One switch:

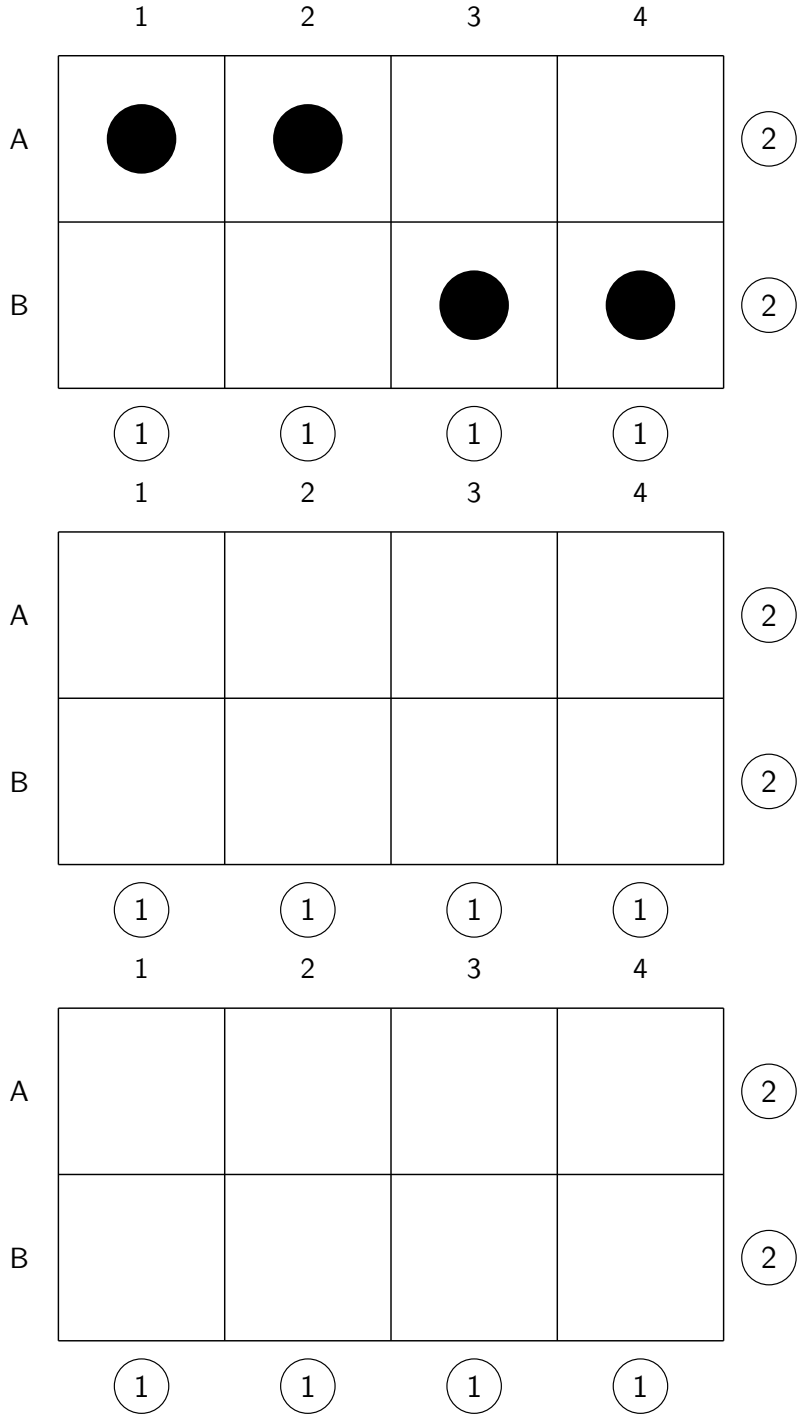

Problem 5: Make a picture on the middle grid that takes exactly one switch to reach from the top picture. Make a picture on the bottom grid that takes exactly two switches and cannot be reached in one. Explain why one switch cannot reach it.

Problem 6: Use four counters on each left grid and write its counts. Ask a partner to make a different picture with the same counts on the right grid. Can you choose your picture so that this is impossible? Explain why.
