A staircase goes only right and up. Measure along all its pieces.

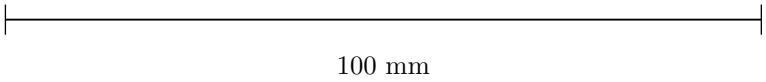

Problem 1: Make two different staircases from S to F. Use string to compare their lengths.

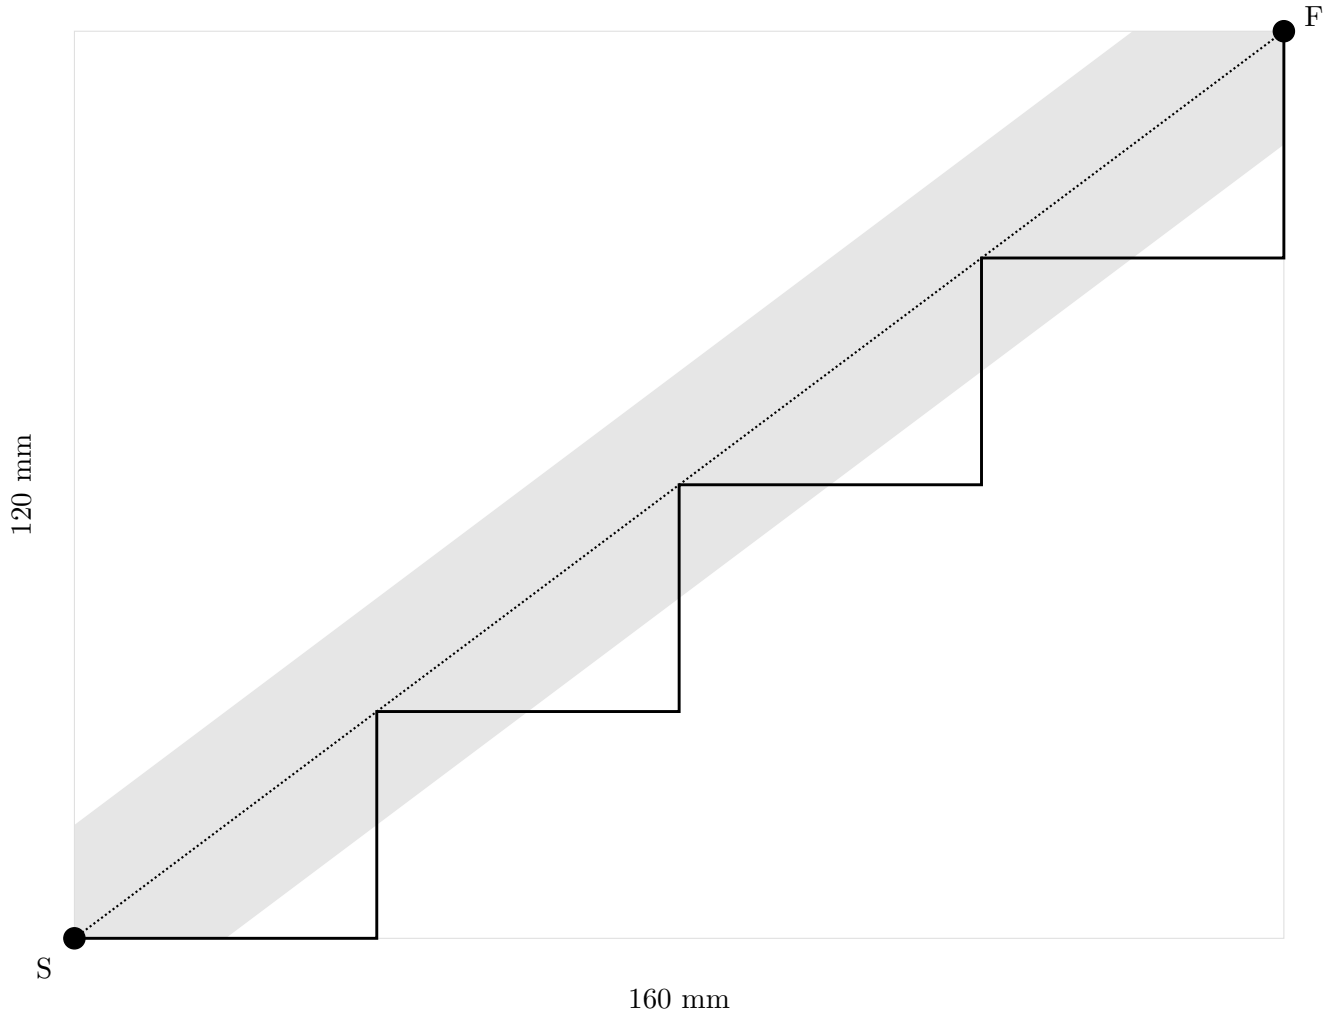

Problem 2: Follow both staircases with string. Compare the two pieces of string.

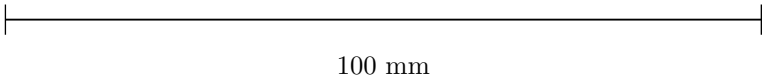

Circle: same length / solid longer / dashed longer

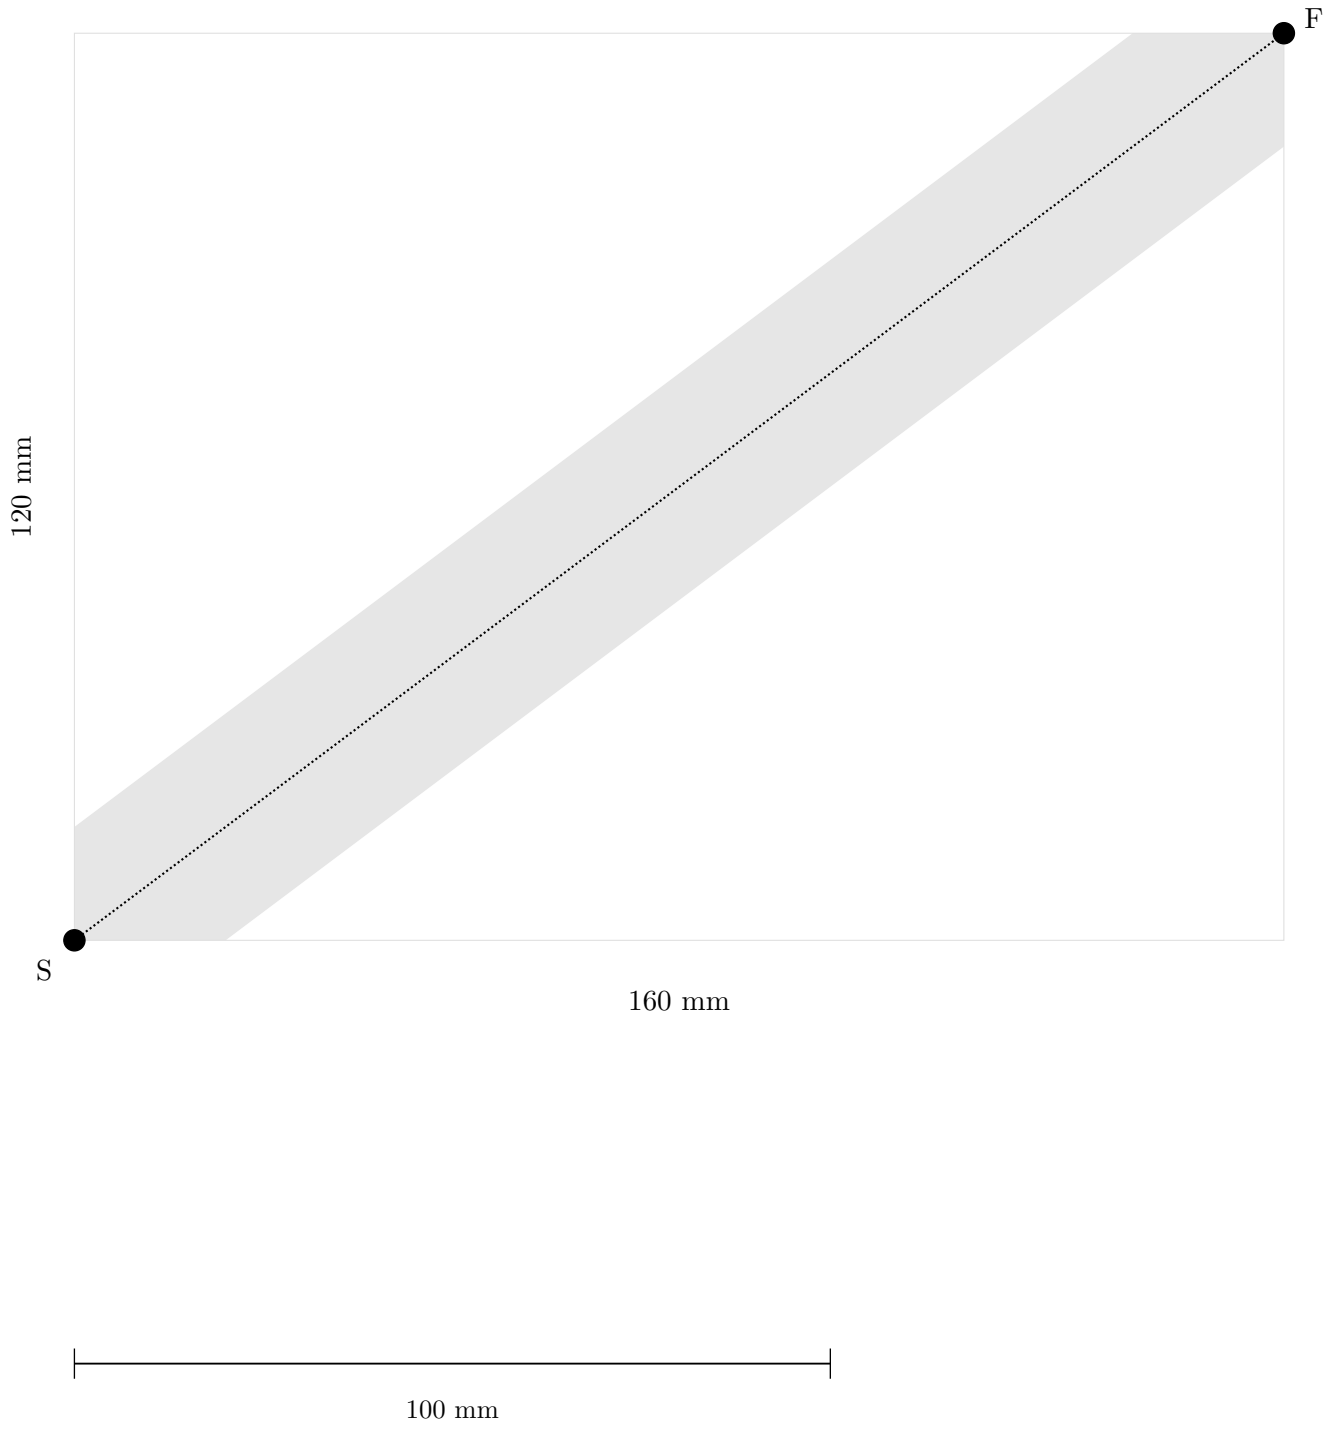

Problem 3: Make a staircase inside the gray strip. Compare its length with this one using string.

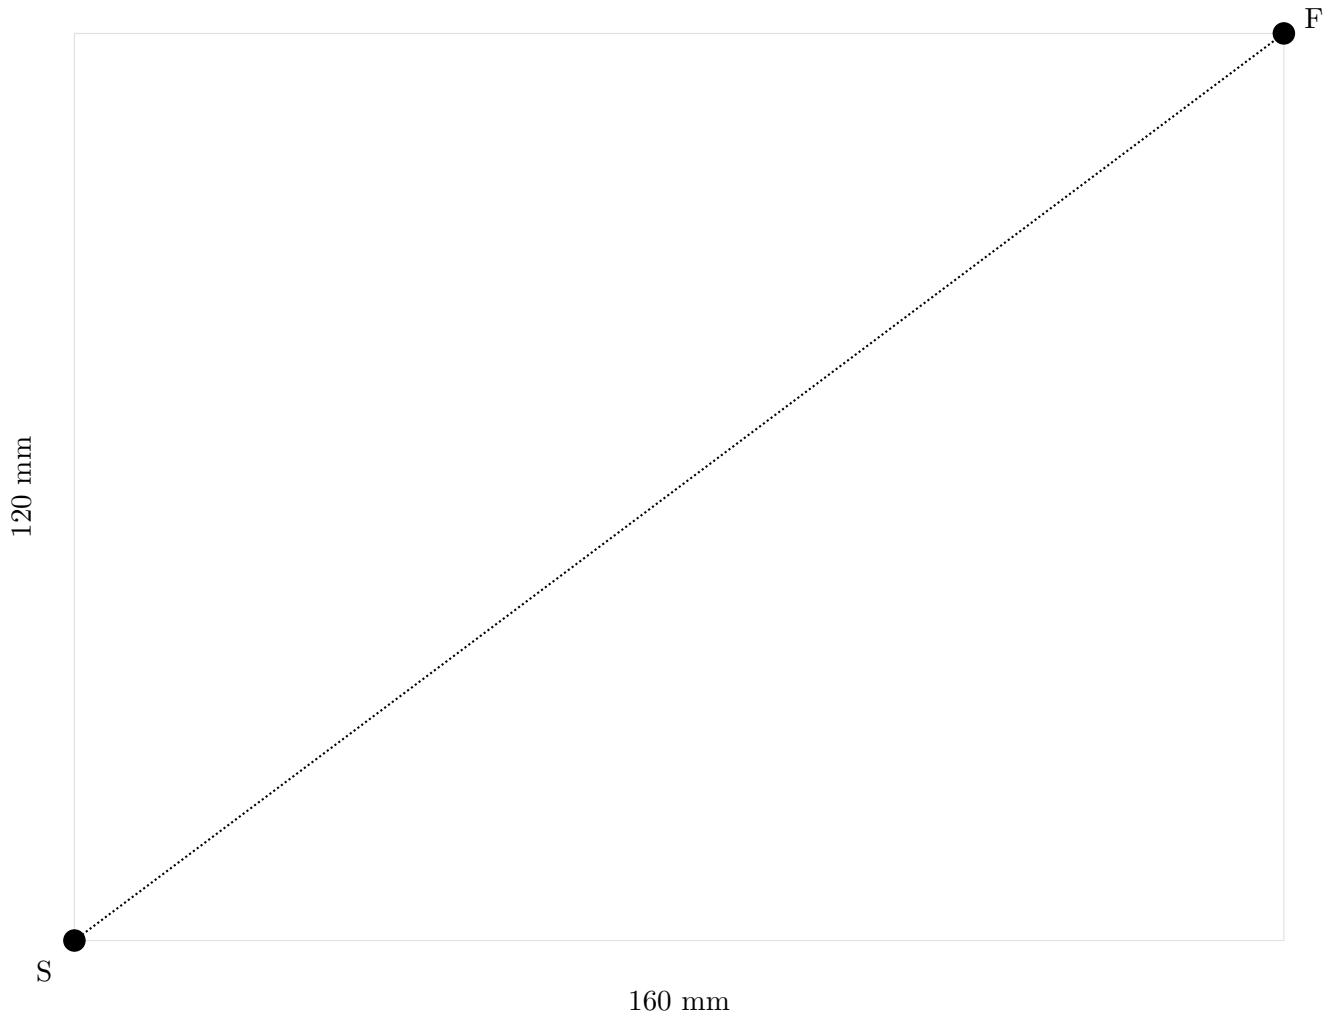

The straight diagonal is 200 mm long.

Problem 4: Make a staircase inside the gray strip with as few turns as you can. Its pieces may follow the edge of the strip.

Problem 5: A path may now go left as well as right and up. Make two different S-to-F paths that use the same amount of string and more than a staircase.

Problem 6: Can a path with a leftward piece use less string than a staircase?
