Add the numbers joined to a circle and divide by how many numbers you added. The answer must equal the circle's number. Squares keep their numbers. Every circle must work at the same time.

Problem 5: Fill each board. Can any board have a different filling with the same square numbers? Find one, or explain why it cannot.

Problem 6: Use whole numbers from 0 to 5. Find every filling for each board, and explain how you know none are missing.
