Squares keep their stacks. A circle holds one equal share of the stacks joined to it. Make one equal pile for each joined shape, including empty shapes. Every circle must work at once. Use spare cubes to copy and share.

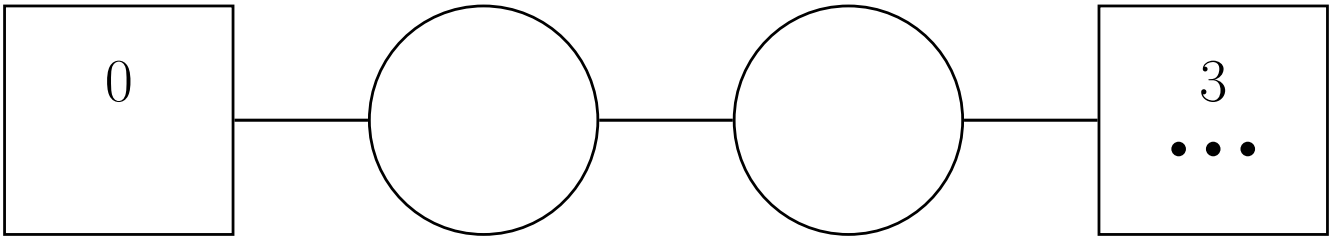

Example: both circles work.

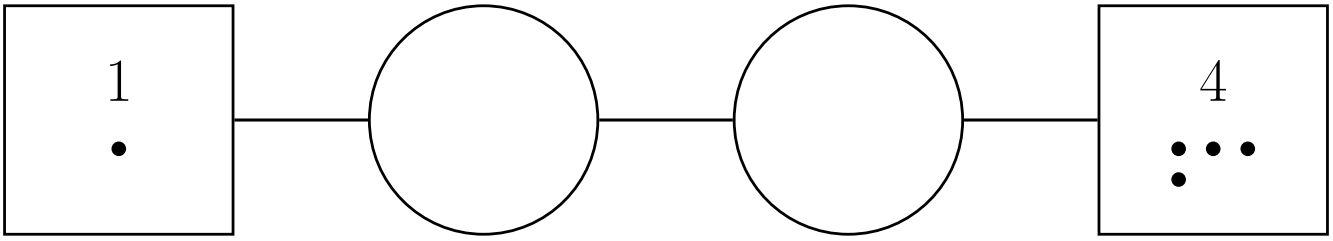

Problem 4: Make all the circle stacks. Both circles on a board must work at the same time.

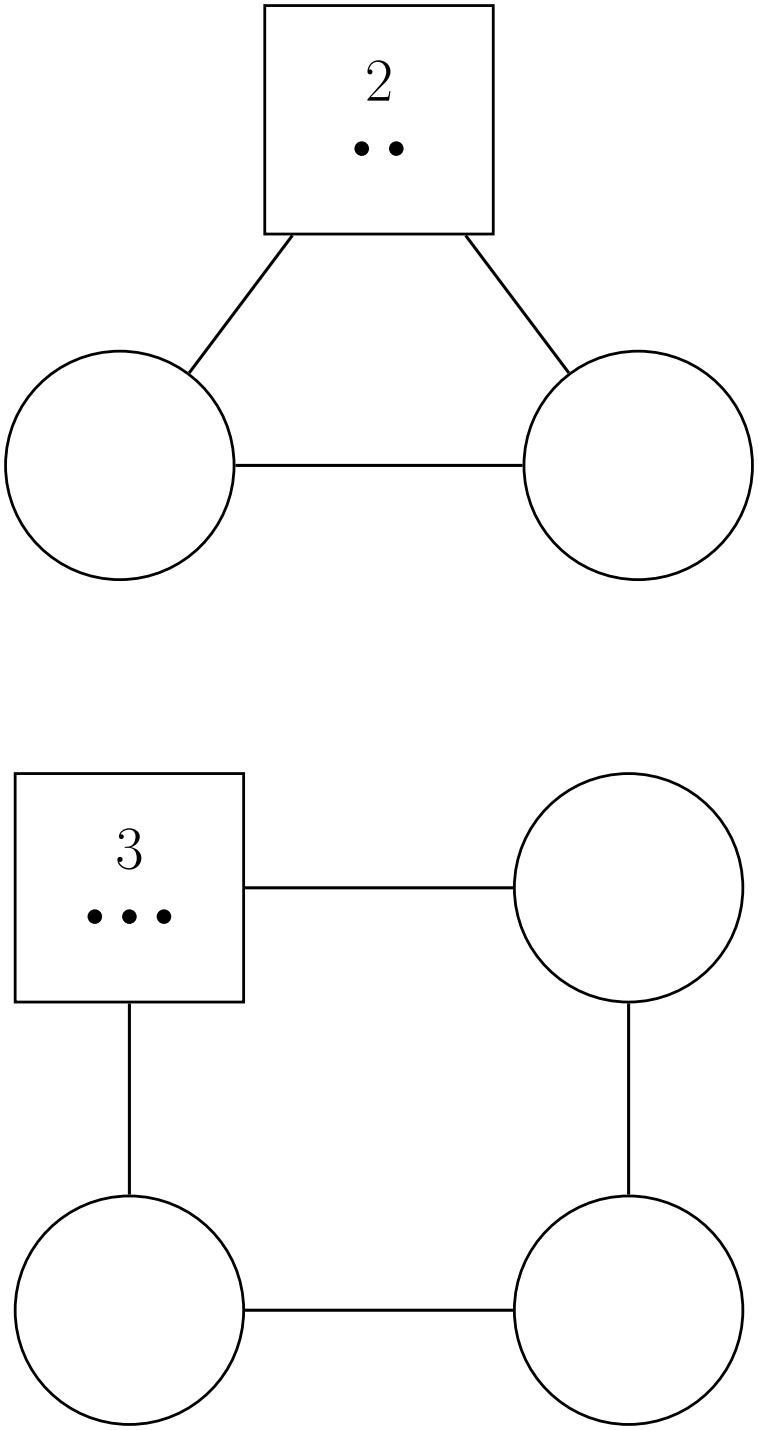

Problem 5: Can you make a 5-cube circle on either board while every circle works? Show why it can or cannot be done.

Problem 6: Fill the circles. Can any circle have a different number of cubes from its square?

Problem 7: Use 0 to 5 cubes in each circle. Find every way to make each board work.
