Each circled number counts the counters in its whole row or column. Put at most one counter in a cell. Two pictures are different if any cell is different.

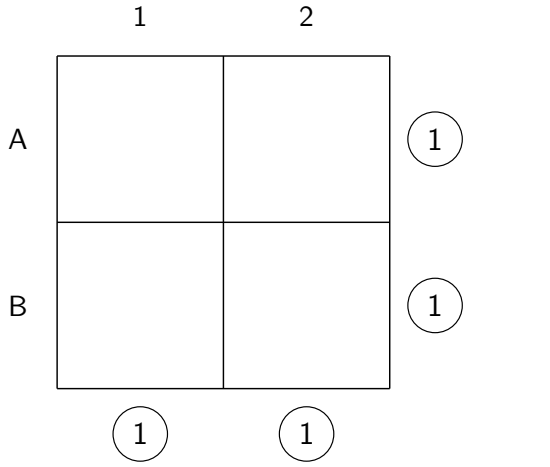

Example: two counters become row and column counts.

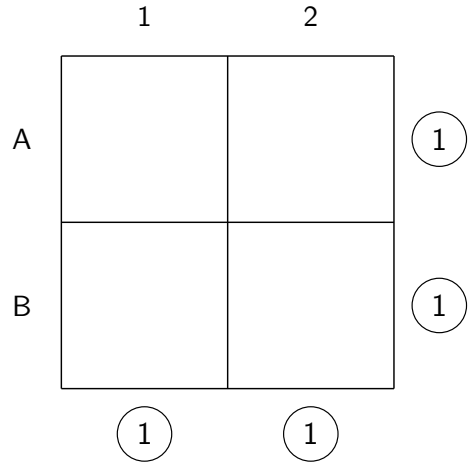

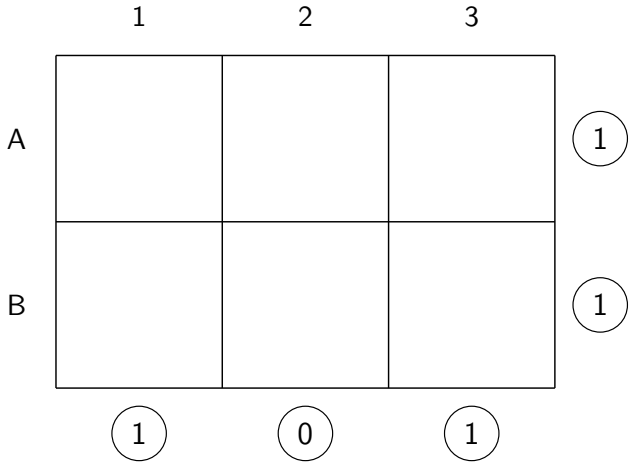

Across each row:

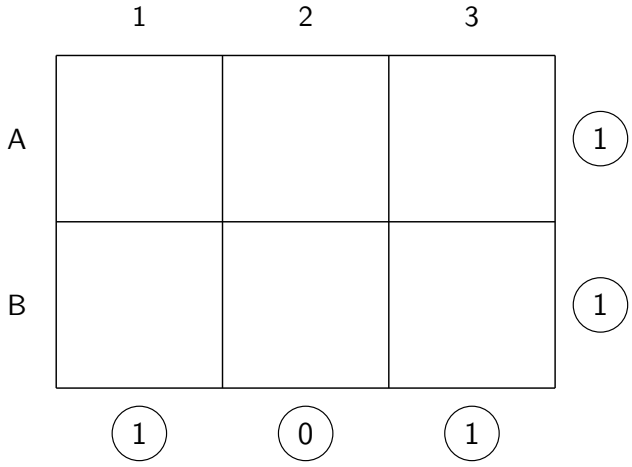

Down each column:

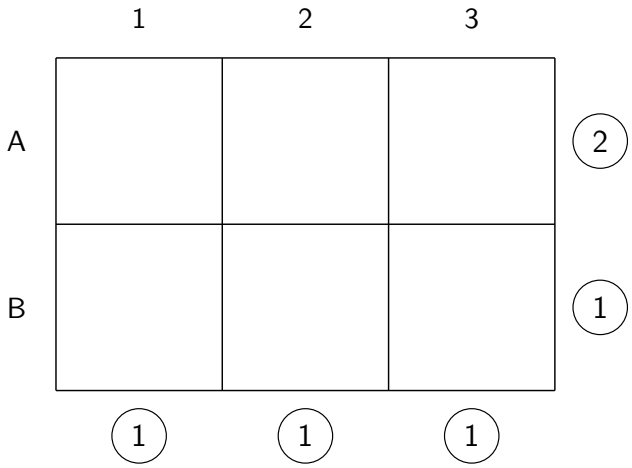

Problem 1: Make two different pictures for each pair of grids. Match all the circled counts.

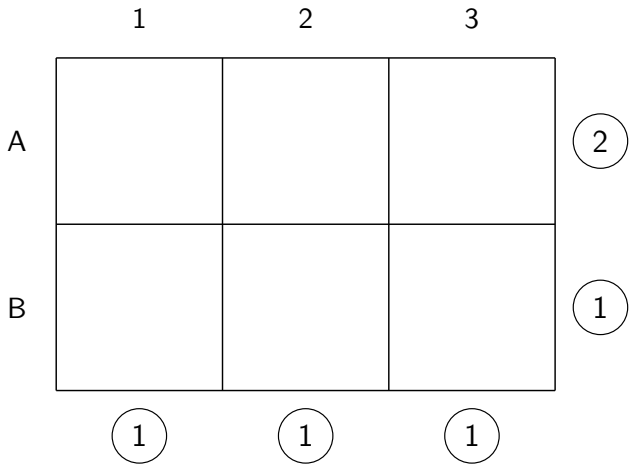

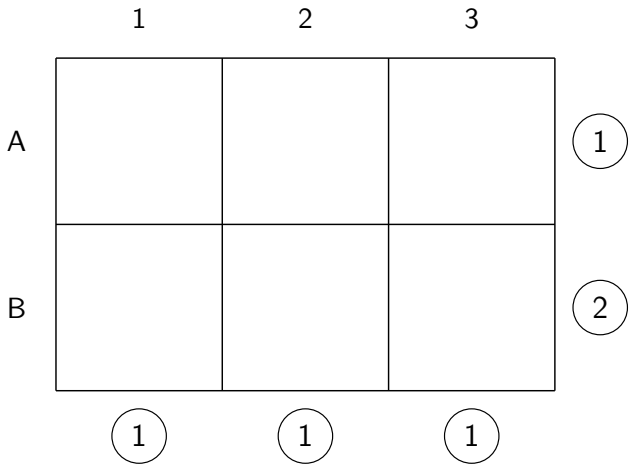

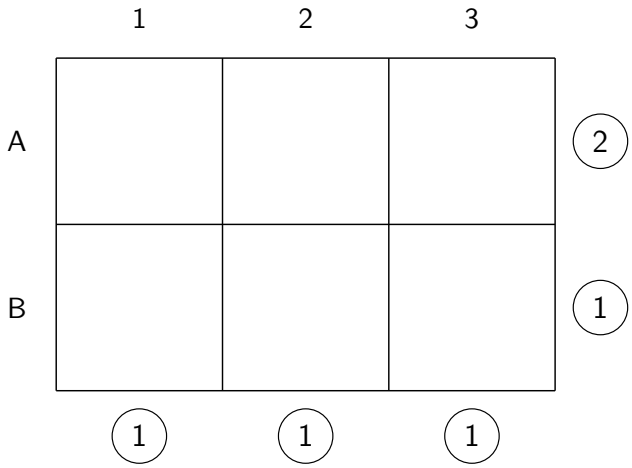

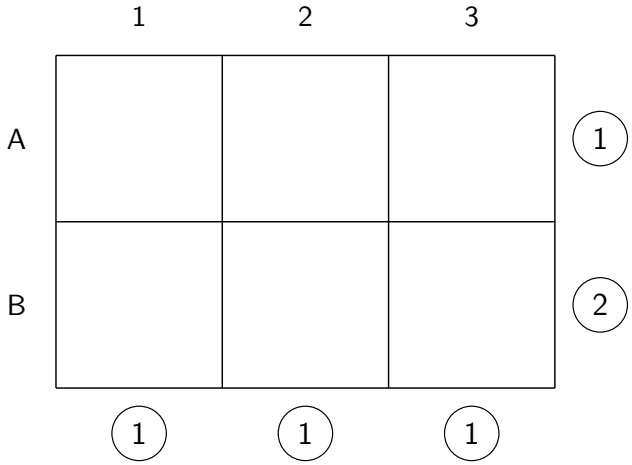

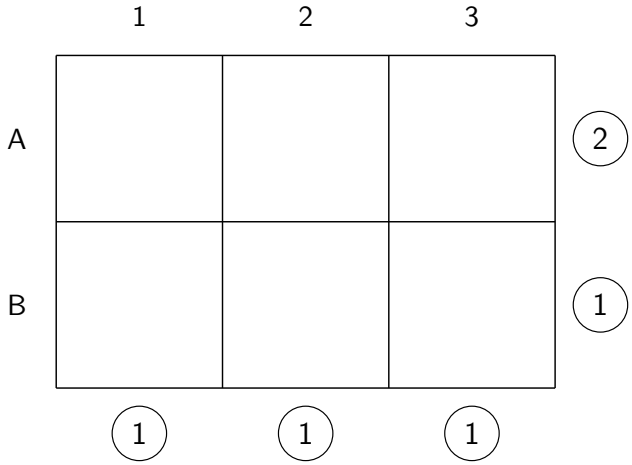

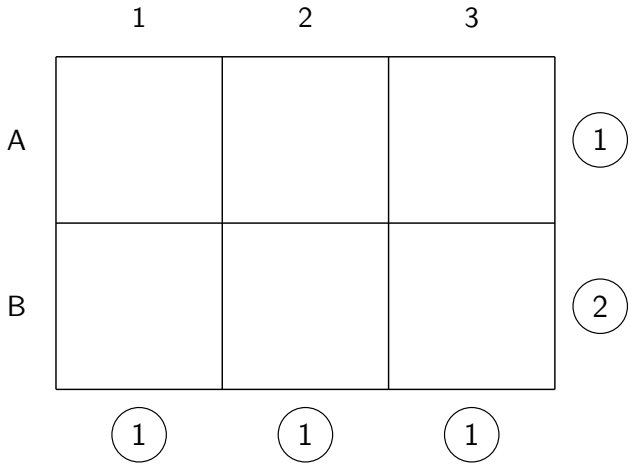

Problem 2: Find and draw every different picture for each set of counts.

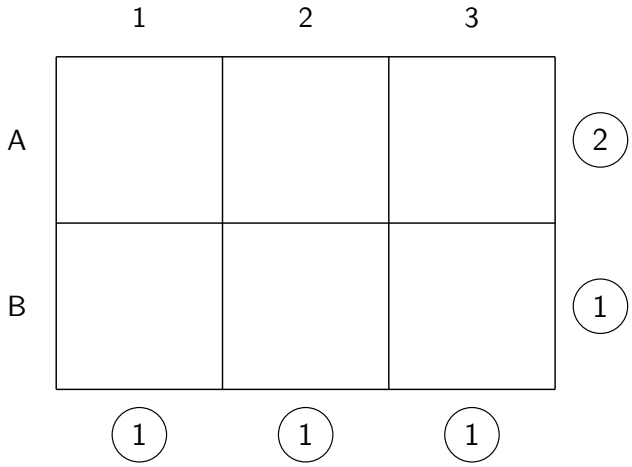

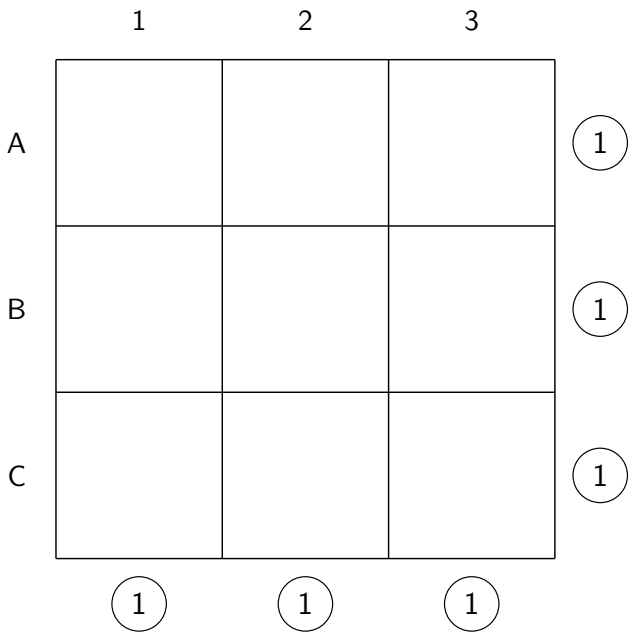

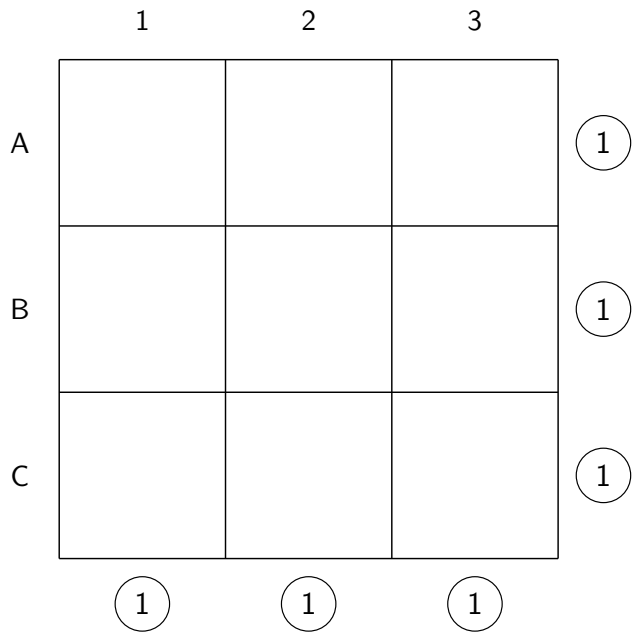

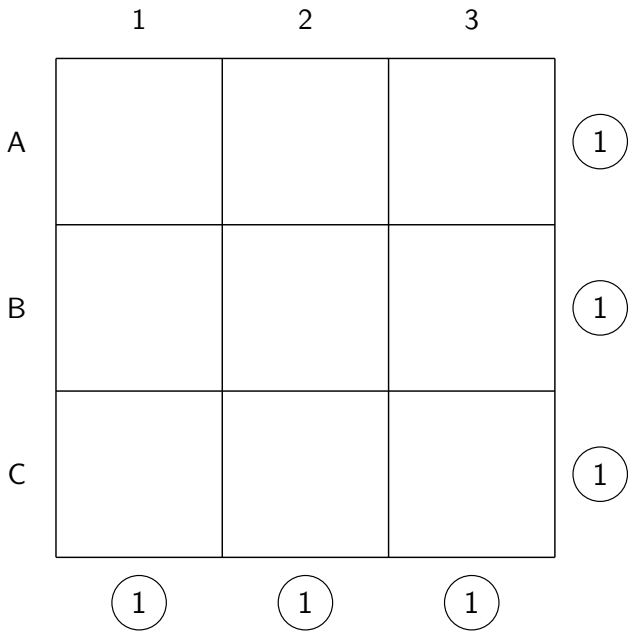

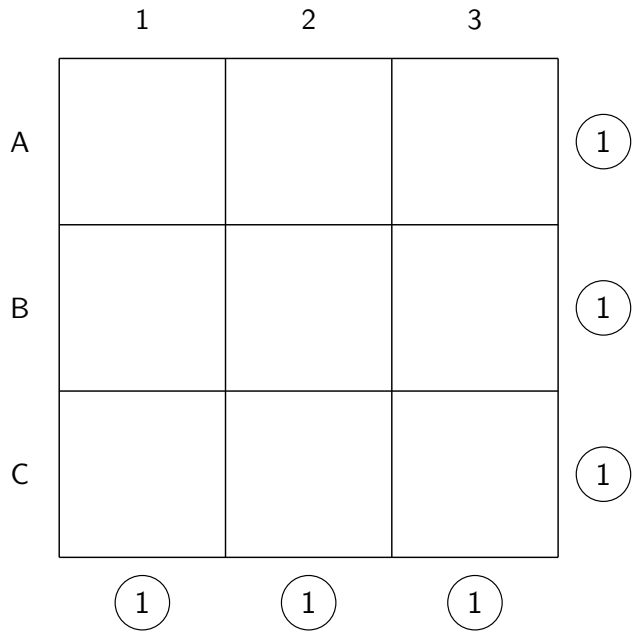

Problem 3: Find and draw every different three-counter picture with these counts.

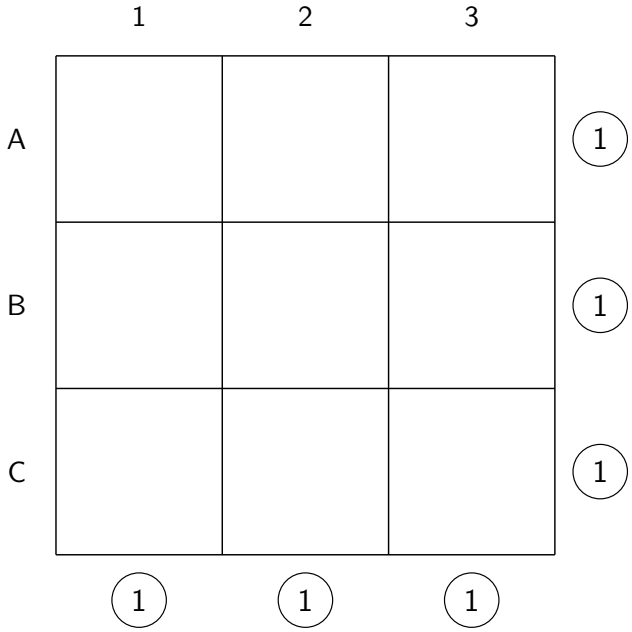

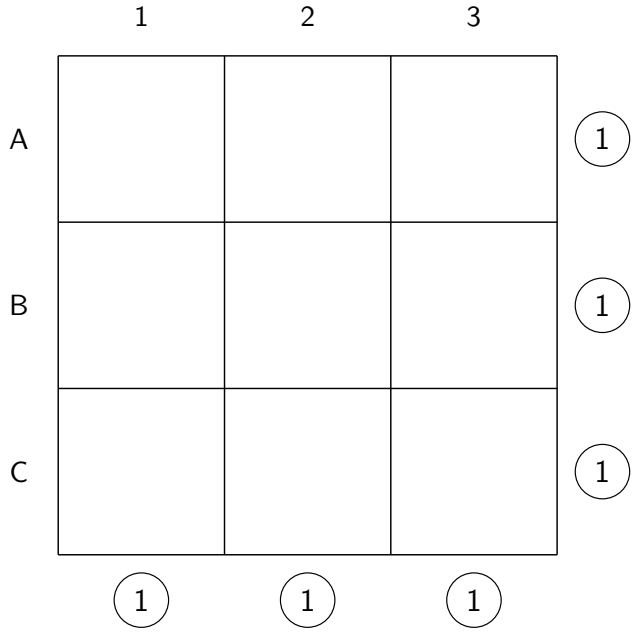

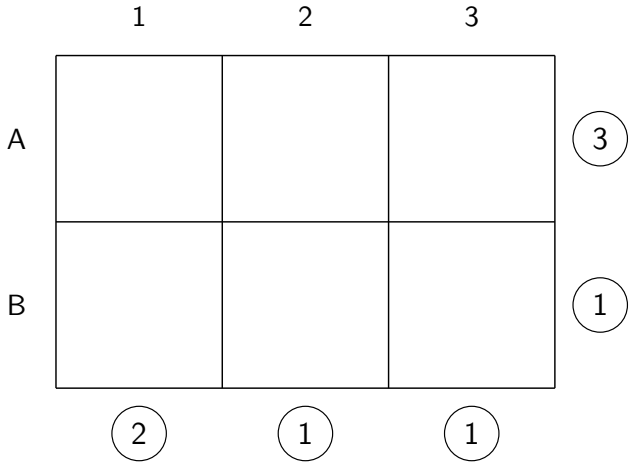

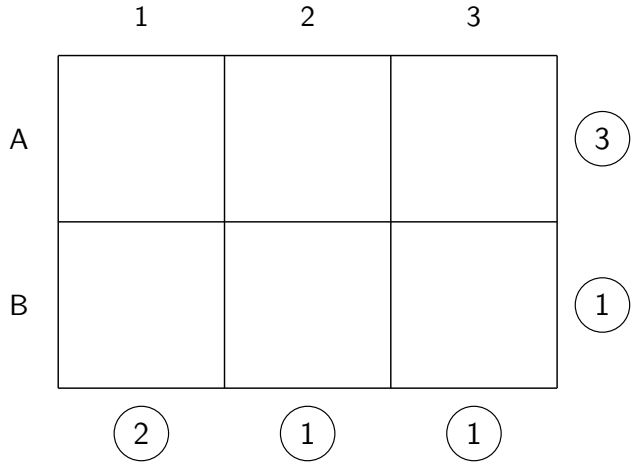

Problem 3 (continued)

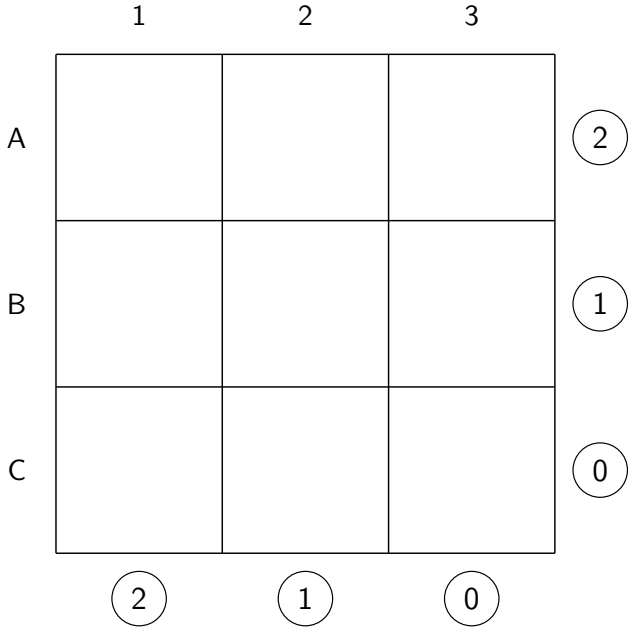

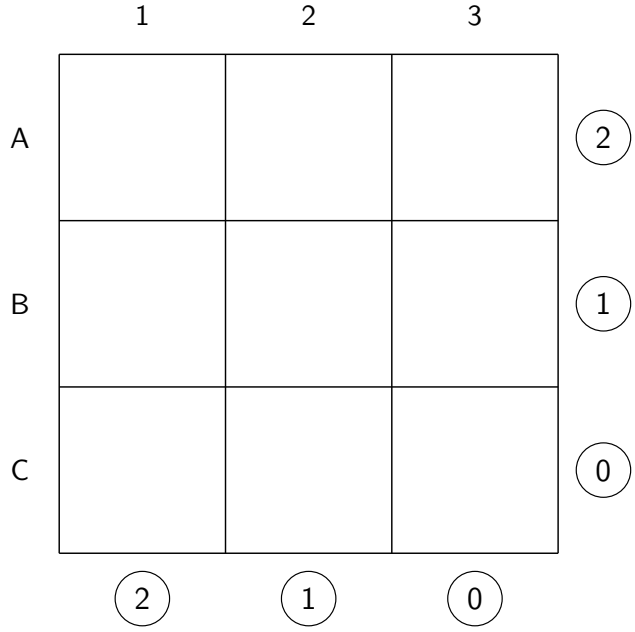

Problem 4: Can you make two different pictures for each pair of grids?

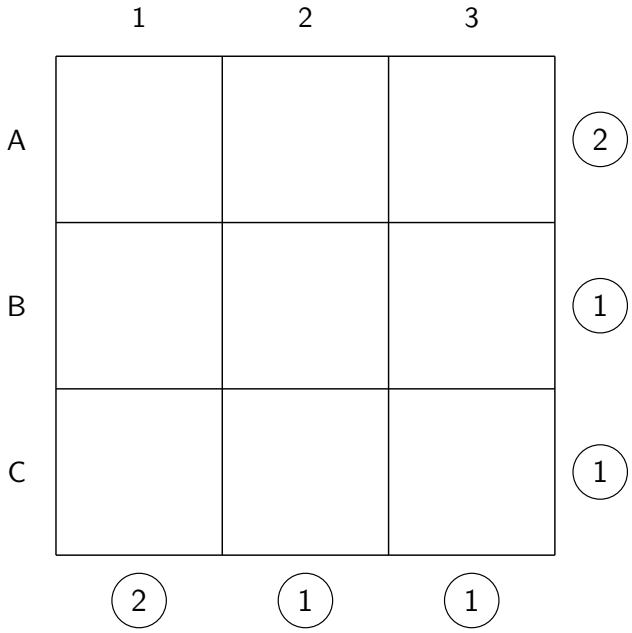

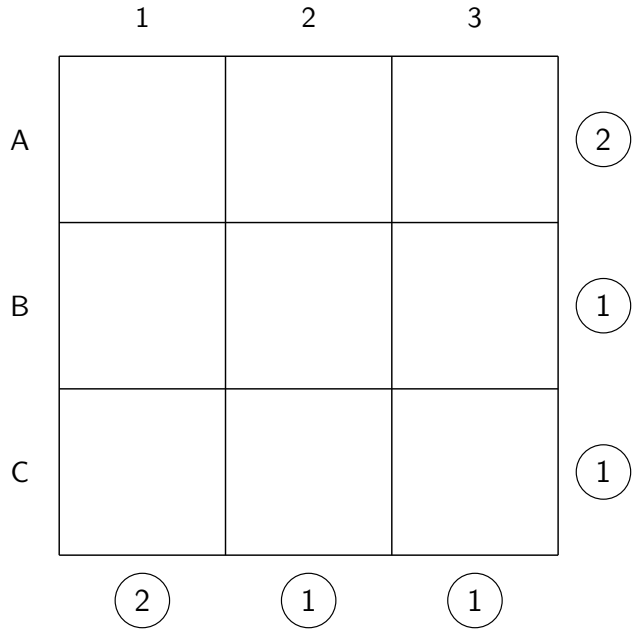

Problem 4 (continued)

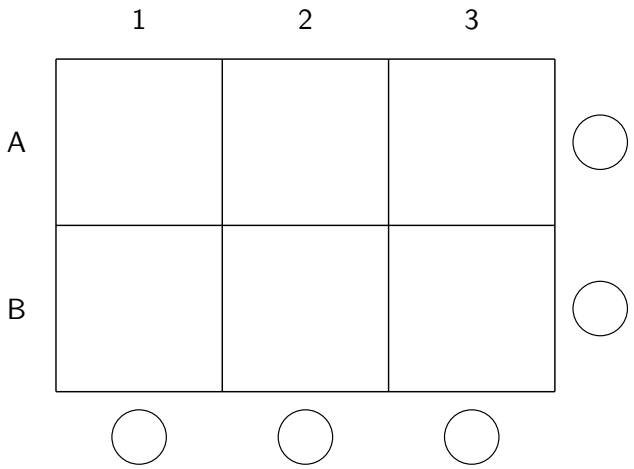

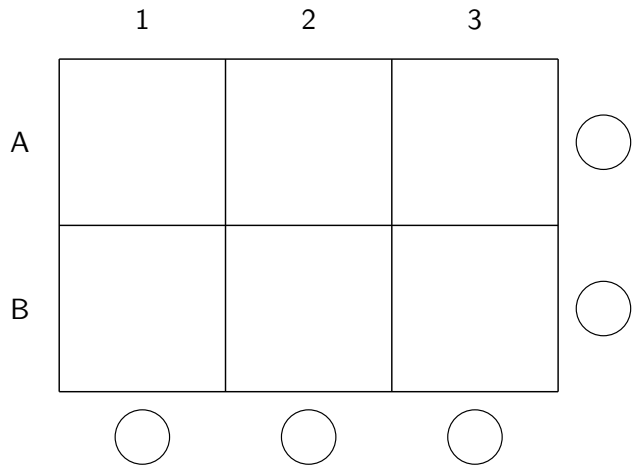

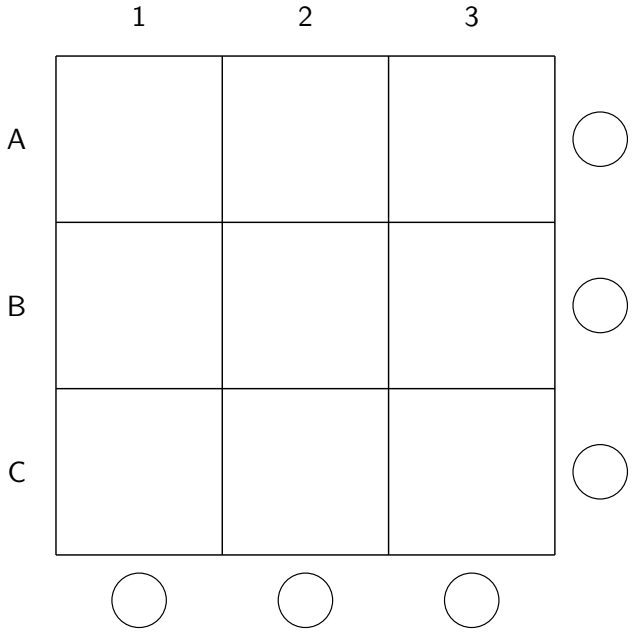

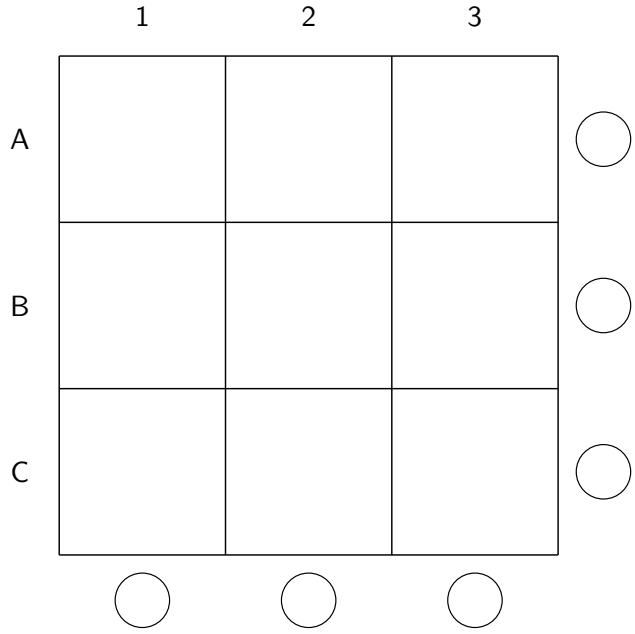

Problem 5: Make a four-counter picture on each left grid and write its counts. Can your partner make a different picture with those counts on the right grid?

Problem 6: Draw a four-counter picture on each grid and write its counts. On the left grids, no other picture may fit your counts. On the right grids, another picture must fit them.
