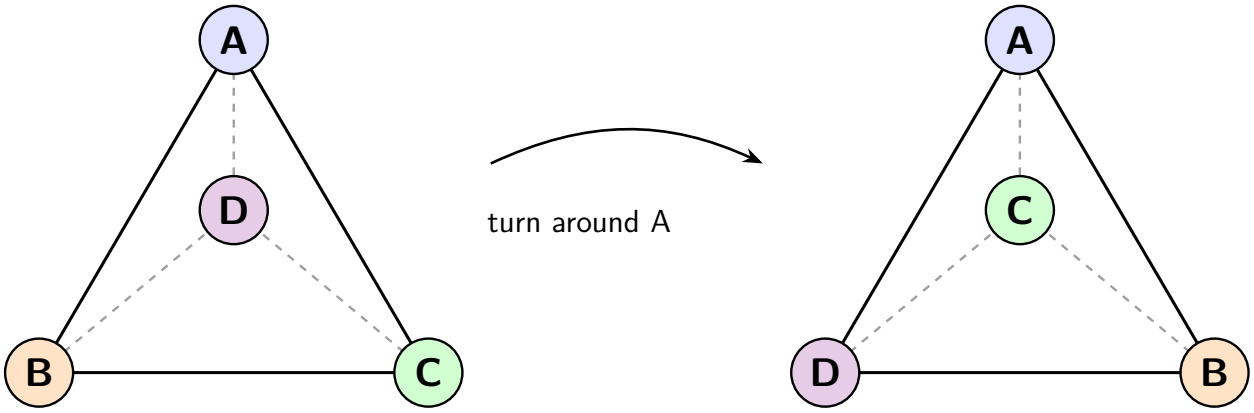
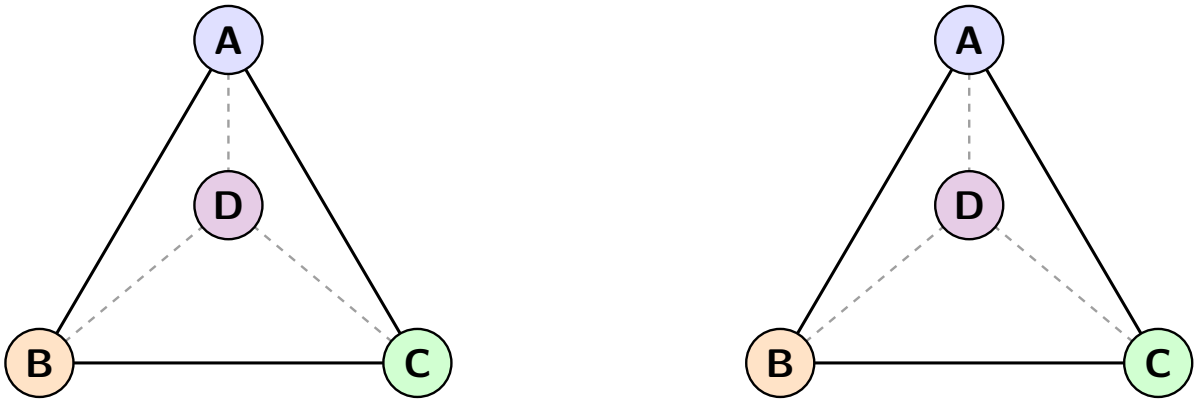
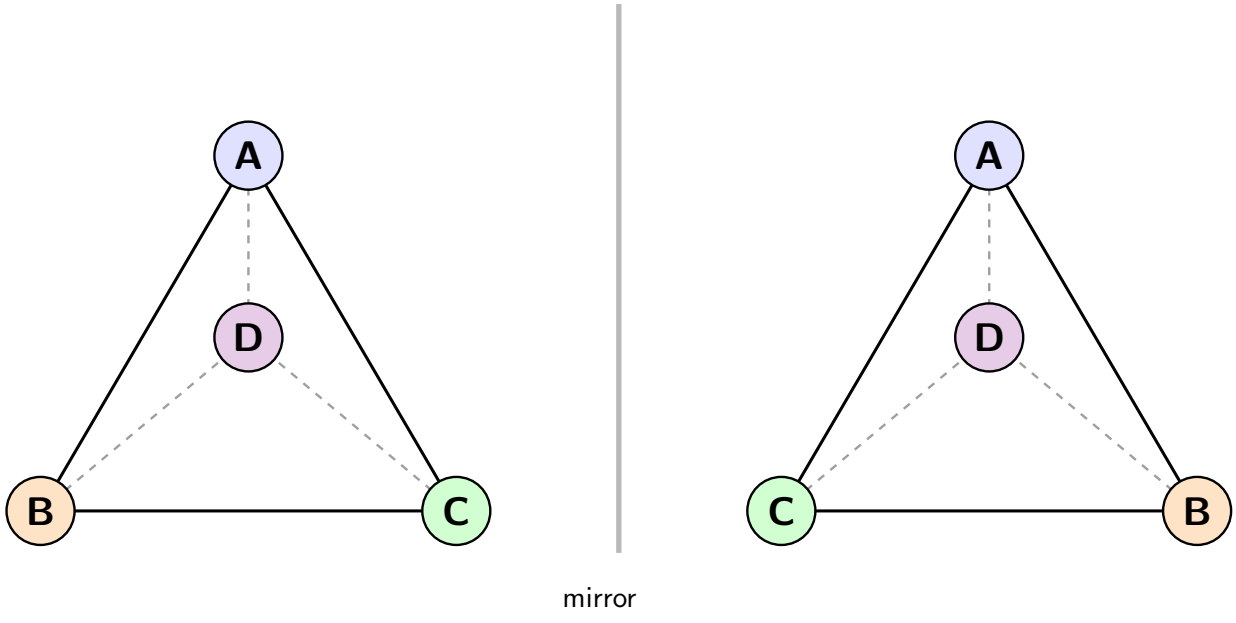
Use the rigid models. Move and turn them so same-letter corners match. Which way a letter points does not count. Keep the markers fixed unless a problem says to change them. Dashed edges pass behind the front face.



Problem 1: Build two copies of the first model. Turn one without changing any labels, and challenge a partner to match it. What has to match besides the letter at the top?





Problem 2: Build the model and its mirror twin. Can one be moved and turned to match the other? Seek a reason that settles this even if no more turns are tried.
