Only tickets 1 and 3 are in the cup, each with the same chance.

Problem 4: Does this way of producing a red clue change the chance that red is hidden? Give an exact comparison with the six-face-ticket rule.

Problem 5: Could six red-showing rounds prove that the hidden-color chances differ?

Use a cup containing a subset of the original six tickets, with no repeats. Each selected ticket has the same chance.

Problem 6: Find every subset that makes red showing equally likely to hide red or blue. Your cup must sometimes show red; it may also show blue.

1	2	3	4	5	6

Problem 7: Can you keep only whole cards and make that red-clue game fair, with red still possible? Keep one, two, or all three cards, and remove both tickets whenever a card goes.
