A network is dots joined by links. You may move the dots and bend the links, but each link stays joined to its own two dots and never lies across a dot. A crossing is a place where one link lies across another, and no more than two links may cross at the same place. A network is untangled when it has no crossings.

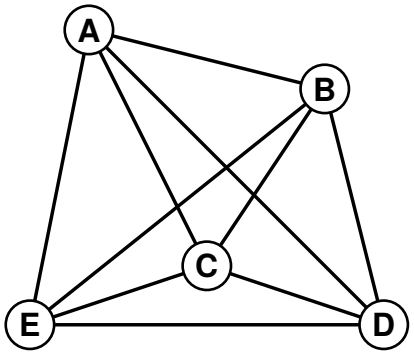

Problem 1: Make each network with dots and pipe cleaners and try to untangle it. In the box beside it, draw it untangled or write “stuck”.

1

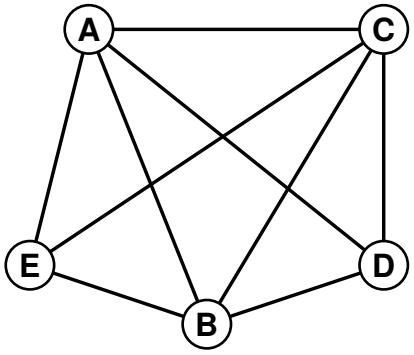

A – B B – C
A – C C – D
A – D D – E
A – E

2

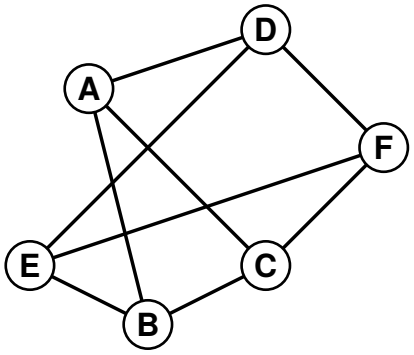

A – B B – D
A – C B – E
A – D C – D
A – E C – E
B – C D – E

3

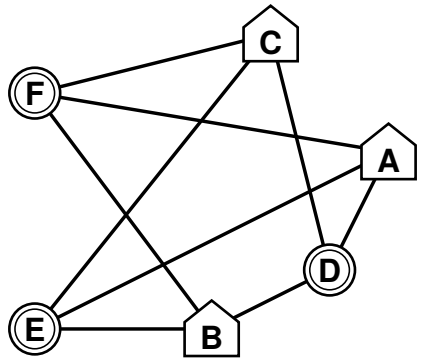

A – B B – D
A – C B – E
A – D C – D
A – E C – E
B – C

4

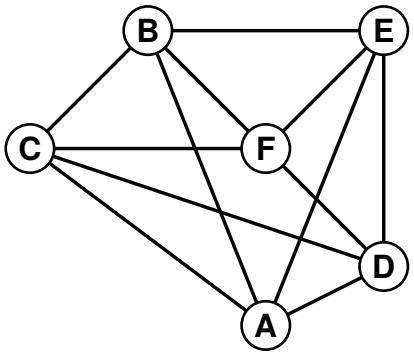

A – B C – F
A – C D – E
A – D D – F
B – C E – F
B – E

5

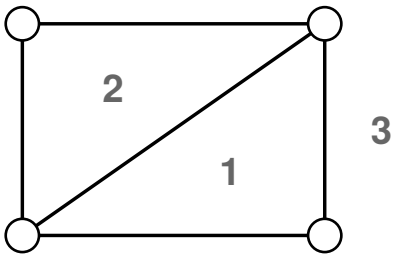

A – D B – F
A – E C – D
A – F C – E
B – D C – F
B – E

6

A – B B – F
A – C C – D
A – D C – F
A – E D – E
B – C D – F
B – E E – F

Problem 2: A region is a part of the paper fenced in by links. The outside counts as a region too. Count the dots, links and regions in each network you untangled. Find a rule connecting the three numbers that works for every untangled network in one piece.

4 dots, 5 links, 3 regions

Network	Dots	Links	Regions

Problem 3: Draw each of these networks with as few crossings as you can.

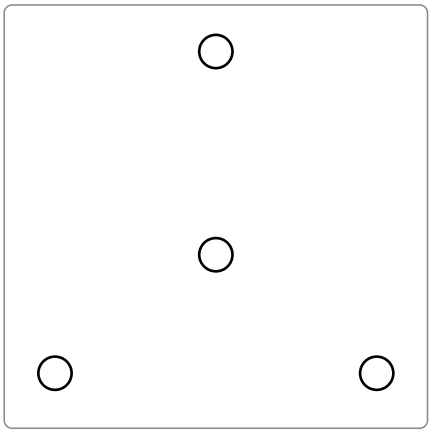

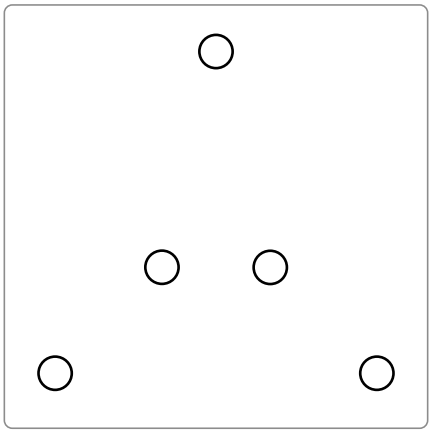

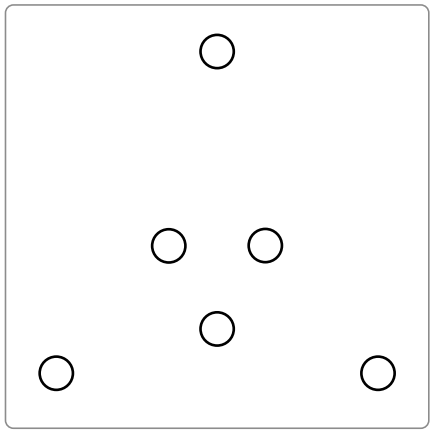

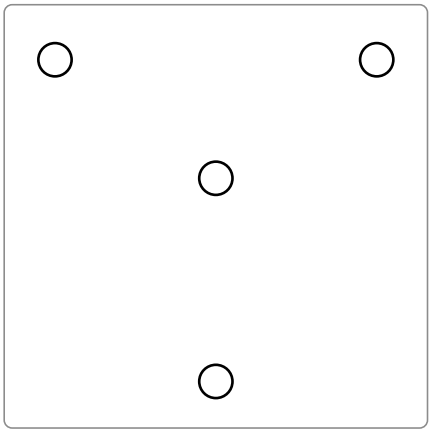

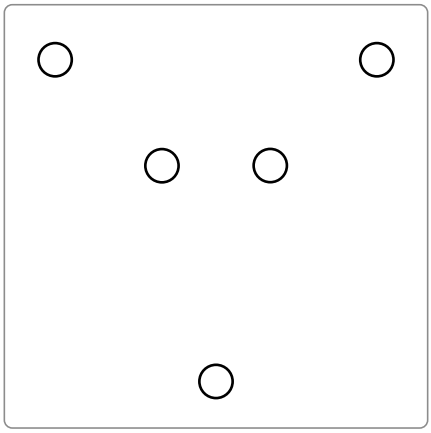

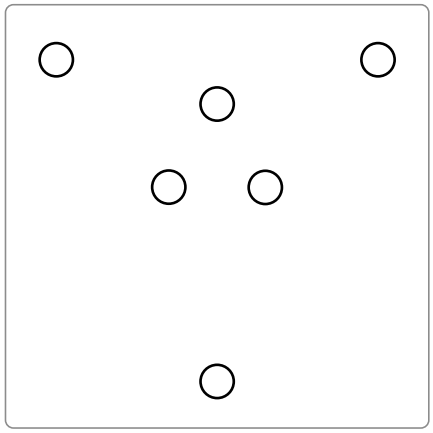

Network 2

Network 5

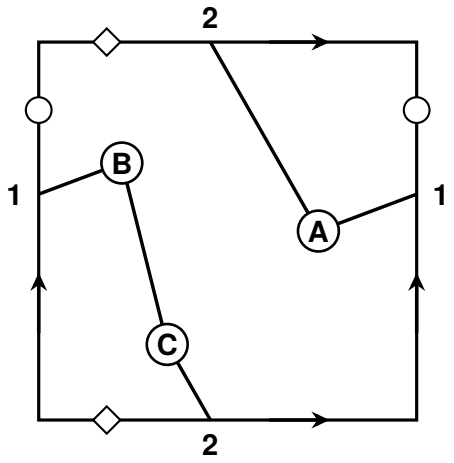

6 dots, each joined to every other dot

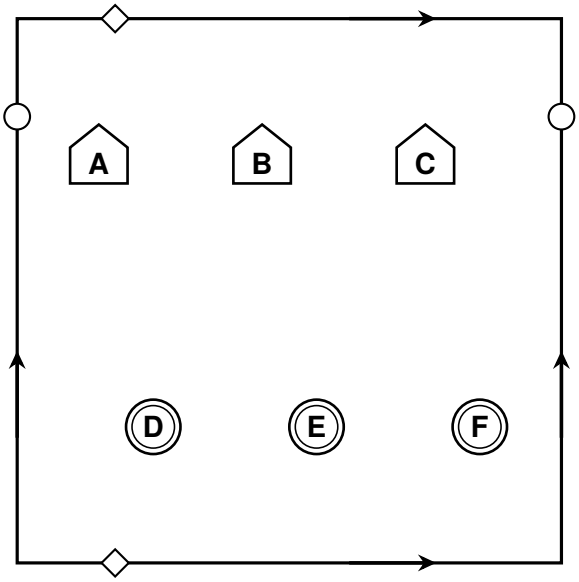

Problem 4: Two players take turns drawing a link between two of the dots below. A link may not make a crossing, and two dots may not have two links between them. The player who cannot draw a link loses. Play with 4 dots, with 5 dots and with 6 dots. For each number of dots, which player wins?

	First player wins	Second player wins
4 dots		
5 dots		
6 dots		

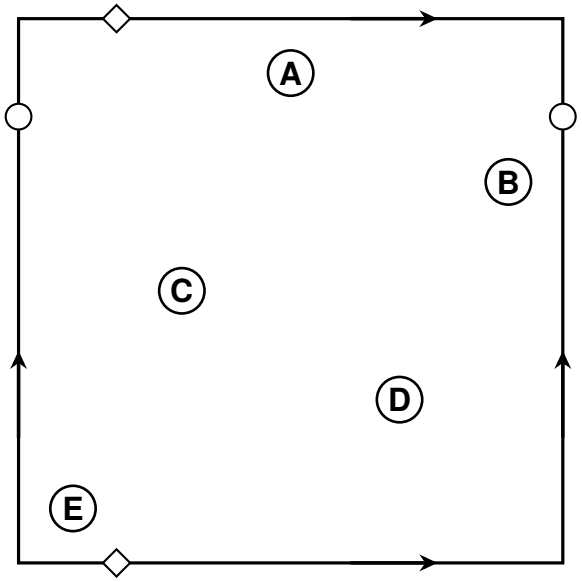

Problem 5: On a portal board, a link that goes out through one side comes back in at the same place on the opposite side. Draw each of these networks on a portal board with no crossings.

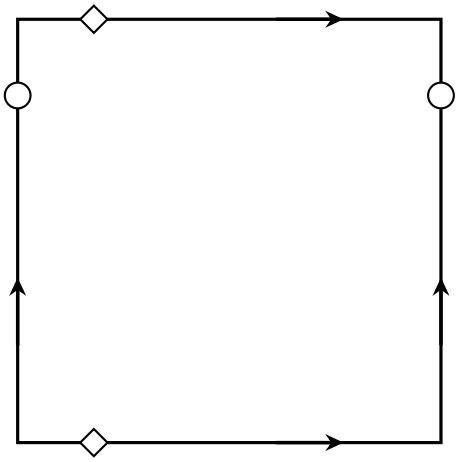

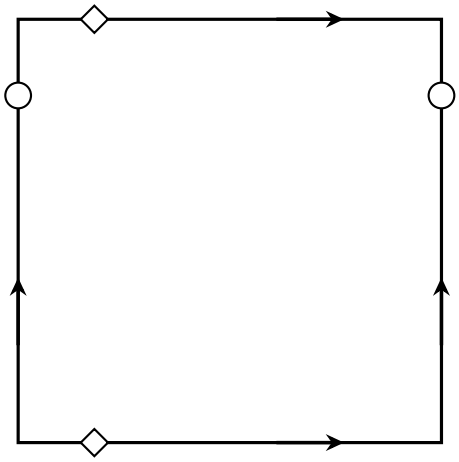

Network 5

Network 2

Extra board

Extra board

Problem 6: Explain why network 2 can never be untangled.
